27183. FT-897D Sale

Yahoo group: FT897 (2009)
Date: 2009-08-07 03:06:29 UTC
From: oscboise
Topic: 27183 Message: 27183

Please buy my FT-897D and others.

Any offers are welcome.

Details are at http://boise.craigslist.org/ele/1308420037.html
<http://boise.craigslist.org/ele/1308420037.html> .

Thanks,

Chul

I wouldn't normally say anything, but I have a personal observation of Dennis and his comments. He has acted as if he was the King and the rest of us are his jesters. He's done this on the repeaters in Nashville TN. He has left a person stranded with vehicle trouble after FD (2008). In short, Dennis does not know as much as he thinks he does and he is NOT a very nice person.

27185. New Member question: how to interface FT897D with Codan autotune antenna 9350

Yahoo group: FT897 (2009)
Date: 2009-08-07 07:24:04 UTC
From: wowi2010
Topic: 27185 Message: 27185

Hello everyone. Happy to join this forum. Greetings from Sydney to all members!
I just purchased one 8 months old FT897D and wondering where to get an interface so that radio works with my Codan 9350 auto tune antenna. A Google search brought up a number of site where people describe how they designed their own interface, however I am not confident to be experienced enough to built my own interface using those available descripitions. Can anyone advise me how I can get the required interface. My other radio is a Codan NGT which I would also like continue to use with same antenna.
tks+cheers
Wolfgang (will only be assessed for Standard Licence this Sunday therefore no call sign yet)

What for noise problem is it some Hz sound at micro audio?
Because a good ham friend of me has that .

27187. First time transmitting and no mic at all...

Yahoo group: FT897 (2009)
Date: 2009-08-09 03:30:26 UTC
From: d_marotti
Topic: 27187 Message: 27187

I just got my 897D and turned it on for the first time today (after having a professionally installed antenna installed). I loaded the software, programed a couple of repeaters (that I use successfully on my VX-8R) and synch'd the radio with the software (RT Systems - love it). I can hear everyone out there perfectly, however, here is now my problem. When I key the mic, I'm not transmitting anything that is audible. I verified this with my VX-8R. I cannot hear myself or anything coming from my 897D. The Tone is correct, the CTCSS is correct, and the Off-Set (and direction) is correct. Even more strange, when I do key up, instead of seeing the meter bar indicating voice peaks, there are no bars at all, and the numbers / frequency "7.197.88" appears on the screen. The green light at the top of the largest dial turns red, so I assume the radio thinks it is transmitting, but it is obviously not. Does anyone have any suggestions? I've waited weeks for this radio, and now I can't talk. Please Help!

From: D. F.
Topic: 27187 Message: 27189

Are you transmitting in split mode? That would explain why, when you transmit, the frequency (if it is displaying a frequency) of 7.197.88 appears in the display. As far as hearing yourself on the HT, has ANYONE ELSE given you the same report, or is it just you that hears this? Next, all your settings for transmit audio COULD be improperly set. There is no "correct" setting here, other than what makes YOU sound good on the air, as told to you by someone listening to your transmission (unless you have all the fancy test equipment and such).

Right now, I would hesitate to say anything is wrong with the radio until you check these things I mentioned first. I am sure someone else can most likely think of some other things to check for as well.

Good luck and let us know!

Dennis - N8BMB

You say you can't hear your voice but does the radio actually transmit
at all? You should be able to tell with a SWR/Power meter into a dummy
load.
Check in the menu for items number 005 & 051 & 074 to adjust mic gain
and processor levels. Instructions can be found starting on Page 54 of
the FT897D manual.
You should also check your mode of transmission to make sure that it is
FM, USB, LSB or AM for voice and not packet or digital or CW.

HTH,
Keith

You're in split mode.

It's on the "A" page (Press "F", turn the dial until the left side of
the screen says "MFa")

Erwin

There are many preamps that are available that will switch out of line.

Most people who do EME/MS will add a PTT sequencer that turns off the preamp
before turning on the power amp, etc.

27193. REVISITED: CW tone goes very coarse & "Fuzzy" when tuned zero beat ?

Yahoo group: FT897 (2009)
Date: 2009-08-10 10:11:21 UTC
From: Victor Ward
Topic: 27193 Message: 27193

Trying again as no reponse to my last post on Aug' 3rd, so getting desperate for help.

The CW tone of my FT897 has developed a very "fuzzy" sound, almost as if the speaker is rattling (also through my Heil Pro headphones), I have the sidetone set at the default setting,
only occurs when I get close to and centre on zero beat, as if the front end is being swamped.
Compaired to my FT817 and Knwd TS570-D it is a very harsh raspy note, at it's worst dead on zero beat.
Speaker shows no evidence of this distortion on other modes, sounds perfect even at relatively high volume, only when at zero beat on CW.

Anyone else experience this? Anyone know of a fix? What have I done wrong to cause this? Would appreciate any advice.

I also had ground related problems with my 897. I even blew the SMT resistor near the key jack like Dennis in this post: http://groups.yahoo.com/group/FT897/message/27116

You need to install a single point ground in your shack. Every single piece of equipment in the shack should have a short ground wire going to a common bus. Splitting your grounds like that will cause other problems (loops and a path for lightning induced voltages). Here's some good info: http://www.polyphaser.com/technical_notes.aspx

Your shack needs a single point ground. It must (should) be bonded to the ground at the service entrance. If you absolutely cannot ground your station's SPG to the ground rod at the service entrance, do not ground the station. I went from burning things up at legal limit to having a nice quiet station. If you continue as you are, you will discover ground loops and RFI at different frequencies but most importantly you will create a path to ground for lightning induced voltages through your station.

Grounding has to be one of the most hotly debated topics in amateur radio. I've probably misstated something in my reply but don't trust me! Search Google for single point grounding and notice how commercial transmitters are grounded. We have water storage tanks at work 150' + with radio equipment installed in them. They are stuck regularly with no ill effects. Water tanks and commercial towers sometimes have strike counters installed and yet the transmitters and other electrical equipment suffer no ill effects.

If all your equipment is at the same ground potential, you won't have any RFI induced either way unless... your ground wires or interconnecting wires are 1/4 wavelength.If you cannot shorten your ground wire, parallel your 1/4 wave length ground wire with a 1/2 wave length ground. I believe HRD mentions an opto isolator OR ferrites. Try a SPG first.

Well done Tom,,,

I was waiting to see how your arrangement would sort itself out !

I had a somewhat lesser but similar problem a good few years ago, it concerned running HF RTTY, and having QSO's on 70.26 MHz, at the same time, on a chat frequency.

I was getting breakthrough everywhere on HF [I was using a Rig Blaster Pro],,, I solved all my problems, by isolating the whole shack, using a 3KW 230/230 VAC isolation transformer, and thus leaving the house mains "outside the shack",,, [all my earths are Shack only RF earths] something in the "loop", seemed to amplify the VHF [AM] and distort all my digi stuff.

There was no Broadband at the time, and that would be making things even worse now a days.

Thanks for sharing that with us.

dek2ty:

A "Single Point Ground" is not meant to be a solution to any RF related problems. It is simply intended to be for electrical and lightning safety and protection. If you have RF getting to that point then you can expect it to show up on equipment connected in some way to the Single Point Ground. You simply can't assume that your equipment is going to be at the same "ground potential" (argh!) for RF regardless of how it's connected to any percieved ground. Lightning and electrical faults are another story.

The problem described was specifically about RFI problems related to a computer TV and other things. This is a problem with RF getting into the house and affecting things.

equipment in the shack should have a short ground wire going to a common bus. Splitting
your grounds like that will cause other problems (loops and a path for lightning induced
voltages). Here's some good info: http://www.polyphaser.com/technical_notes.aspx
> >
> > Your shack needs a single point ground. It must (should) be bonded to the ground at the
service entrance. If you absolutely cannot ground your station's SPG to the ground rod at
the service entrance, do not ground the station. I went from burning things up at legal
limit to having a nice quiet station. If you continue as you are, you will discover ground
loops and RFI at different frequencies but most importantly you will create a path to
ground for lightning induced voltages through your station.
> >
> > Grounding has to be one of the most hotly debated topics in amateur radio. I've
probably misstated something in my reply but don't trust me! Search Google for single point
grounding and notice how commercial transmitters are grounded. We have water storage tanks
at work 150' + with radio equipment installed in them. They are stuck regularly with no ill
effects. Water tanks and commercial towers sometimes have strike counters installed and yet
the transmitters and other electrical equipment suffer no ill effects.
> >

> > If all your equipment is at the same ground potential, you won't have any RFI induced either way unless... your ground wires or interconnecting wires are 1/4 wavelength.If you cannot shorten your ground wire, parallel your 1/4 wave length ground wire with a 1/2 wave length ground. I believe HRD mentions an opto isolator OR ferrites. Try a SPG first.
> >
> >
>

So you feel that his solution (two grounds) is a good one? You don't feel that this will create ground loops and the potential for damage due to lightning induced voltages? He did mention "RF coming from computer to radio", I suspect that that is a ground loop. Perhaps I should have worded my post a little better.

Whenever you mix computers and grounded audio equipment, you have ground loop problems. In my case, I have a ton of audio equipment and a second computer with its own audio equipment connected to the same computer that the radio is connected to. The house's ground situation is abysmal, and since I rent, I don't get the luxury of doing everything the way I want. My solution is the best one I was able to come up with considering the constraints I had to deal with.

Hi ALL .
Very many thanks to those on QRZ.com for taking the trouble to respond to me. I tried one more thing before attempting to do a factory re-set as suggested by Werner PAØFLE and it worked for me. I had returned all of the menu settings to default but overlooked AGC as it doesn't appear as a menu item - so I missed it.
Thanks to Ronald NN4RH for pointing me in the right direction - he was spot-on.
The problem was being caused by the AGC setting that was set incorrectly, once I corrected this - all is now OK.
Rig is now singing in perfect pitch with no distortion at all. The answer to my problem was on page 25 of the Yaesu FT897 Operating Manual (last paragraph), something new I learned today.
Once again, thanks all for your help, it is much appreciated. I hope others may benefit from the airing of this issue.

Your probably not listening to the music equipment and working on the radio so turn off the music system and then keep a good safe ground. What would it cost to start over?

Hi,
I don't have a specific answer to your question but.... make sure all the digital filtering and noise blanker are turned off and then
see if that affects the problem you are having. Could be an unhappy DSP filter trying to do something it just can't quite do.

---------From the manual (esp key "C")

Multi Function Row "p" (MFp) [DNR, DNF, DBF]

[A] Key: DNR
Press the [A](DNR) key to activate the DSP Noise Reduction system.
Press and hold in the [A](DNR) key for one second recall Menu Mode No-049 [DSP NR LEVEL] (for setting the degree
of DSP Noise Reduction).
[B] Key: DNF
Press the [B](DNF) key to activate the DSP's Auto Notch Filter.
[C] Key: DBF
Press the [C](DBF) key to activate the DSP's receiver Bandpass Filter.
In the SSB, AM, FM, and AFSK modes, press and hold in the [C](DBF) key for one second to recall Menu Mode No-
047 [DSP LPF CUTOFF] (for adjusting the high-frequency cutoff of the DSP Bandpass Filter).
In the CW mode, press and hold in the [C](DBF) key for one second to recall Menu Item No-045 [DSP BPF WIDTH]
(for setting the CW bandwidth)

Okay, look... I know I'm not a moderator here, but I'm getting really frustrated at people going off topic and trying to start (or continue) debates about things that aren't an FT-897.

I didn't join the mailing list to have an argument about the topic of the week. When people got in to the "skin effect" discussion, I finally just sent the posts, unread, to the trash bin.

Can we stick to discussions about the *radio* and its accessories, leaving arguments and OT discussions to places like the qrz forums? I'd like to think we can all cooperate in not filling up everyone's mailboxes with junk when one post about the topic will do. Including the replies, this is now, what, #5? The first one was sufficient.

My original post enumerated the reasons I needed to isolate the radio, and you can type until your fingers are blue - it won't fix the underlying problem. It will be enough to make me drop this mailing list, and I'd like to think that I've been helpful here. I've certainly gleaned some knowledge from this list, but I get enough OT arguments from various mailing lists that I just don't have a tolerance for it any more.

Thanks.

I also had issues with ground loops using my PC, rigblaster pro, HRD, and skype as a remote control station. There was an obvious AC hum until I stopped using the onboard audio and switched to a usb sound card. All issues solved, PSK worked, remote skype audio was fine, even playing audio mp3 files work (not that I ever rebroadcast anything though. :)

Sometimes removing wires, wiggling them, changing them and choking them works, you just have to take the SWAG approach and keep on until it's fixed. I assume RFI can be just as daunting a challenge...

I imagine, without opening my unit, that there are unique RF cable that go from both the receiver and the transmitter to a T/R relay somewhere. I would just pull the receiver one off and add an external connector.

27209. Problem

Yahoo group: FT897 (2009)
Date: 2009-08-12 13:55:25 UTC
From: Sam Saladino
Topic: 27209 Message: 27209

Last night when I turned on my rig, the BATT A LED was flashing, I have no internal batteries installed. I'd switch the rocker switch on top of the case to position B and the BATT B LED would flash. Later instead of flashing it went to constant LED on. This morning I did a full reset, and no change. Of course after doing the reset I had to reprogram my 2 Meter Repeater Frequencies in, and discovered the Tone Board is apparently not working either. I have full power out, checked using a Wattmeter but can't bring up the repeaters.

I'm wondering if something may have happened during the storms that rolled through here a few nights ago. Anything I can check, or try to rule that out?

My transceiver is the FT-857, little brother to the FT-897, which
has no batteries. I don't know what the 897's battery connector
looks like, but is it possible that it's shorting against something
in the case that's stimulating the battery indicator LED? One
would think that something must be competing the circuit in
order to light up the LED.

Not sure if it makes a difference, but, do you have the brown wire connected or is it making/breaking contact with power and/or ground? It (brown wire) is part of the power connection off the back of the radio and intermingled with the red and black. I do not use mine.

Next, take covers off and ensure that ALL screws securing the boards are tight. The 857 has an issue with these coming loose.

Try those and see if that helps.

I had never taken off the cover to even look, but I did now. There are two connectors, PC Board Mounted on the non-foil side. Each connector is a plastic housing with 3 metal pins which are recessed beneath the edge of the housing. Nothing in there to short out against. So if there is a short it would have to be on the other side of the PC Board and I'm assuming major disassembly of the rig. Thanks for the idea though.

Sam NW9T

Topic: 27209 Message: 27213

No, no. The brown wire is part of the power leads NOT INSIDE THE RADIO. If you look at them you see the large gauge red & black wires. Intermingled with them is the brown. Make sure it (the brown wire) isn't shorting or making contact with power or ground intermittently. Sometimes the brown wire just hangs around, and if it contacts something it shouldn't, it could give a false "warning" or indicator.

The screws I refer to are inside the metal radio housing. They secure the boards to the chassis and provide a ground for the internal components. ALL screws should be checked to ensure they are tight. These screws have nothing to do with the power leads. There are no plastic housings we are looking at/for. Depending on where the screw is located, if the screw comes loose, it can cause all sorts of unwanted problems from bad audio, to power issues.

One other thing I forgot to mention, is your power supply providing enough power and/or amps? You NEED a power supply of 13.8 volts and a MINIMUM of 20 amps. If the power or amperage is not sufficient, the radio may indicate a "Batt" issue. Check your supply and ensure you have the proper power to the rig.

Thanks Dennis N9BMB my response was to KD5SAK Harold's Post, I didn't see yours until just now. My power supply lead only has a red and black lead, there is no brown wire, with the power leads or connected to the power connector among the power leads. The Red lead branches into two red leads that are in the power connector and the Black lead does the same, no other wires.

As far as the Power Supply it's the Kenwood KPS 15 power supply, same one I've been using with this rig for the last 6 months. Amp Rating is 23 Amps continuous with 25 Amp surge. Voltage out reads 13.9 volts on my VOM.

The rig has only been used here on the desk, and not moved around or used in a mobile situation so no idea how a screw could work loose, but I'll double check just the same. Thanks again for your input and assistance.

Not a problem.

The screws issue does not require any bouncing around or vibration. Not sure what the particular issue could be, could just be a fault at manufacture. Don't really know. But check them anyway.

OK, will do just to be safe. That's also a common problem in the old Kenwood TS 120S xceivers. Loose screws as well as corrosion building up on the joints between the metal chassis parts, which I think was caused by using dissimilar metals. I still have mine, but about once a year or sometimes less I have to take it apart and clean all the joints and tighten the screws. If not it wanders all over the place and won't stay on frequency. Thanks again for your help and I'll double check the screws.

Checked all the screws and everything feels tight. I unplugged and replugged the rocker switch used to switch between A and B batteries several times into it's corresponding socket to make sure it was seated well. Also checked to make sure no visible shorts between wires on rocker switch. No change, LED still flashing.

Interesting that you say that. About 2 weeks ago, I noticed the same thing. I am going to check the menue to see if something needs to be turned off

27220. New HAM needs assistance ... :)

Yahoo group: FT897 (2009)

From: leekianbeng
Topic: 27220 Message: 27220

Hi,

I am a new HAM. I just obtained the following :

1) Yaesu FT-897D
2) MFJ 949E
3) MFJ 1622

Well, I live in a high-rise apartment, therefore I purchased the MFJ 1622.

The problem I am having is that I am getting a lot of noise. My S-meter level, if that is correct is always around S7 to S9.

I just keep on hearing lots of noise and I can't seem the tune my antenna down to a SWR of less than 2:1. I am just getting 2.5:1.

I had attached 2 counterpoise wires to the MFJ-1622 but it doesn't seem to help much.

I am trying to get on 20m and 40m.

I would appreciate any advise.

Thanks :)

27221. No power on?????????????

Hi Guys! Just thought I'd say hello as I'm new to the forum.

I got my FT-897D yesterday and plumbed it into the car this morning - just on 2m/70cms and 6m at the mo. I've a few questions about it but will open a new thread each time rather than in one long post!

But! My first question is....

The front of the manual says FT-897D but on the rig it just says FT-897 (on the front and the side). So.... do I have an D or not? And what is the difference?

David G4TUP.

27223. Yaesu FT857/897 reliability

Have the current crop of Yaesu FT897D and FT857D (within the last 2 years or so) had all of the problems worked out of them? I know some of the early models had problems with RF feedback changing the hidden menus, and an incorrect bias affecting 6m audio, things like that. Have these been fixed? Are there any other recurring problems showing up in these radios-or other things that affect the reliability of them?

I am going to set up a 4 band dipole antenna for this new used rig using a Jetstream Dipole Kit. My question for all of you is what bands would you set the dipole up for.

Specifically I am interested in learning CW this winter and getting into PSK31. PSK31 will require 20m and 40m.

Any suggestions?

oh, there are still some bugs....

1. When your antenna is too close to the radio on CW, RF can blow out the keyer.
2. Switching channels while in "REV" (listening to the repeater input)
will reset the current memory cell.
3. I found another bug involving manually entering a frequency while
in MR mode. It also reset the current memory cell.

That's just on my 897D... I'm sure other people have found other
undocumented behaviors. :-)

The signal reports I've gotten, as well as my impression from
listening to other people seem to indicate that the default EQ is the
most comfortable for day to day communication.

As to the switch on the back... try them both and see which you like.
Personally, I didn't notice enough of a difference to care either way.

If you look at the spotting networks, the most PSK31 action seems to
be on 20 and 30 meters. I've also made some contacts on 40, but 40
seems dead since around May or June. (I have no idea why that is...)

Personally, I'd go for the 75/40/20/10 bands.

You'll get pretty close on 30 meters and 12 meters - enough to be
productive on those bands with a tuner, and you should get 6 meters
and 15 meters for free.

If you want to work 160, look at building a compact antenna... you can
end-feed a

I own an 897D and live on the 14th floor of a New York City apartment building. Considered many options for an antenna, since I have no balcony, no access to the roof and can't put anything outside my window.

I finally settled on a Super Antenna, which is a hand-tuned screwdriver antenna. I have it mounted inside the apartment with a counterpoise, cut quarter-wave for 20 meters hanging outside the window. Took forev er to tune the antenna but the results have exceeded my expectations. Since I made my first contact at the end of February, I have worked nearly 30 states and more than 40 foreign entities. Got a 5-7 from the island of Crete last night, 5-9s from England and Cuba and a 5-7 from Poland.

As for noise, you can reuce by playing with the IPO, DSP. As you get more used to life on HF, your ear will get filter at filtering out QSOs from the noise.

Bounce back with any questions.

I wanted to provide a follow-up to my "AWFUL NOISY" Jeep Liberty post from a while back:

Last night I replaced my old, undersized battery and gave the radio a try. I am still receiving the same noise, and at the same intensity too.

My next step is to attach bonding straps from the hatch door to the hinge frame, from all four doors to the hinge frame, add a second bonding strap to the other edge of the trunk hood to the frame, and finally a strap from the tailpipe to the frame.

I will post back with the results whenever I find time to try this out...

Deion:

Exactly what type of noise are you getting?

There is no point to trying to fix the noise problem until you know where it's coming from and how it's getting into the radio. That you tried replacing the battery indicates that it might be alternator or computer related noise on the 12V power, but you then talk about bonding straps for the doors, which might be related to radiated noise getting to the antenna.

What can you tell us about the nature of the noise? Do you get the noise with the antenna disconnected and the squelch open? Let's see if we can help you find the source. It may be easier to kill it there.

I did just this, but only have three sets of legs... with which I can work 75, 40, 20, 17, 15, 12, and 10 meters.

http://www.hamuniverse.com/ae5jumultibanddipole.html

17, 15, 12 meters require a tuner, but the LDG AT-897 easily tunes these bands. 10 meters, 2:1 SWR, if that is acceptable, no tuner. But the LDG tuner easily tunes all bands down to 1.1:1.

In this page at Hamuniverse you will see that I used a plexiglass center with SO-239. Recently the unprotected socket got some moisture (Louisiana, go figure) and I replace that entire center section with a Jetstream Dipole Insulator, with a spreader or backboard made from a piece of cheap plastic kitchen cutting board.

I'll add photos to my AE5JU folder in the Files section.

leekianbeng:

Welcome to radio operations from an apartment! I've done this in the past and it can be a pain.

It's a given that there will be considerable noise sources in close proximity to your antenna and equipment. The best way to deal with that is to keep the antenna, as much as possible, away from the building and noise sources. This means not only the antenna itself, but also the counterpoise (ground side of the antenna) which is also very much part of the antenna. If you're using the building as the counterpoise, you may be picking up noise that has been induced into the building structure. The same would be true of cold-water pipes, and particularly of electrical grounds.

There's two things you can do about this.

One is to configure your counterpoise outside of the building, which I assume you are trying. This could be something like a light-weight wire running down a floor or two to a friend's apartment where it ends with an insulator to isolate it from the building. I'm sure there's other ways to do this as well, but the idea is to keep the entire antenna outside the building, counterpoise and all.

The second thing is to make sure you don't conduct noise out to your antenna via the transmission line or any other control line to your antenna. Your transmission line of necessity runs from inside the building where the noise levels are higher out to your antenna. As such it may very well get noise induced onto the outside of the line and that noise could then be coupled into the antenna and get back into your receiver input. The best way to stop that is to add chokes on the outside of your transmission line where it leaves the building and also where it connects to the antenna.

Of course it may very well be that there is just going to be noisy in the area where you live and you're not going to be able to avoid it. How far up the building are you? Are you well above street level and away from any other exposed power lines and such?

Another thought is if there are any other Hams in your building. I do know that in some high-rise apartment buildings the Hams got together to convince the owners to let them install a common Ham station at the top of the building and to put the antennas up there, which would be farther away from the noise and a better location generally. The general argument for this is that doing this avoids the potential for interference from the Hams back into other units in the building and it offers incentive for Hams to locate in the building. Might be worth

looking into.

Good luck!

From: Rob - W1AEX
Topic: 27223 Message: 27240

John,

I have an FT-897D that was manufactured in 2004 and would have to say it has been extremely reliable. It exhibited incorrect bias settings and developed the runaway oscillation issue cased by loosening mainboard screws. Those were very easily resolved and it has been trouble-free since then.

One of the modifications that I have appreciated most is DG2IAQ's flickering squelch fix. I often use the 897D to scan the aircraft and marine bands and it is far more pleasant to listen to with smooth squelch operation. I am unaware of any changes by Yaesu in the squelch components, so if you experience the flickering squelch issue and find it to be annoying, you might want to consider doing that. It takes about 15 minutes.

It was suggested by at least one member here that the newer 857/897 units are using different PA devices in the HF/50 final due to the end of production of the 2SC5125 devices. It that is true, that may have resulted in a design change that could have corrected the wandering resting current issue. I have not encountered any 857/897 units or seen any schematics with anything other than the 2SC5125 output devices, so I can't comment on that.

At any rate. They are great rigs and generally trouble free. I won't be parting with mine any time soon!

73,

Rob W1AEX

Have tested RF with a field strength meter and not found anything worrisome. More to the point, the antenna and the rig are in different rooms, linked by around 60 feet of coax.

Have never tried to go above 100 watts but dont see any safety issues with my present set-up.

27242. RE: [FT897] Re: New HAM needs assistance ... :)

Yahoo group: FT897 (2009)
Date: 2009-08-14 11:32:52 UTC
From: Dr Mark Vaughan
Topic: 27220 Message: 27242

The question would be how is that field strength meter calibrated?

AND In the near field it's a pretty useless measurement.

MOD sites don't use the field strength guidelines, but watts/ meter cubed. Instruments made by firms like RAYHAM which are very expensive. We usually calibrate these by putting them into a strip line cell where we have a uniform volts/meter field strength that is easy to quantify. I won Raham meters, and calibrated isotropic field strength meters for RFI/EMC work.

Usually the best and recommended option for a ham is to use simple calculation methods, those these do not account for gain lobes on an antenna.

As to the health issues, I am aware of a hams using an indoor antennas on 50W that went blind doing so. He moved to a small apartment and shortly afterwards started suffering eyesight problems, his eyes appearing milk rather like cataract. Being an enthusiastic ham he discussed his radio activity with his doctor who managed to make the possible link. The ham stopped using the radio for 6 months and his eye site was then pretty much back to normal. This was a few years back, but since then I've heard similar issues with eyesight and skin problems. The worst seems to be working in close proximity to magnetic tuned loop antenna's.

Since you have them in two separate rooms some distance apart you are probably OK. As an example, I run a Carolina Windom along my garden, but the neighbours house also has an extension that is a few meters from the Windom. At 100watt his rear bedroom is safe, but at 400W into the antenna we start to hit 55 to 60 V/m which is on the high thresholds in a controlled environment, and well above the levels in uncontrolled public area environments of around 25V/m.

We've done other tests with ATAS antennas mounted on the bonnet of a car, or beside a rear window. These radiate little from the coil, but lots from the whip. Mounted on the rear edge of the bonnet, and the top of the steering wheel is around 50 to 60V/m. It's quite easy for a rear bumper mount to be potentially damaging passengers, many don't carry passengers in the back, but consider the family man with children in the back, best to keep such antennas up on the roof.

Hope that helps anyone else also concerned.

DE N7UVL,
A bit additional clarification to the below statement about
Field Strength Meters:
-Field Strength Meters, as used by most Hams are "relative".
Relative to orientation to the antenna; Relative to the distance
from the antenna; Relative to the SWR feed to the antenna;
Relative to the type of antenna; Relative to the power fed to
the antenna.
-While more sophisticated RF volt meters are/can be calibrated,
there are few uses to the "average" Ham for this type of calibrated
equipment. Using the antenna on a "calibrated" antenna field
specifically designed for antenna design work; and at a Ham Radio
"antenna shoot-out" are some. (Because those are controlled
conditions).
-As soon as you move the Field Strength Meter (or the antenna),
you no longer have the same relative reference point.
-That said, the Field Strength Meter does have its uses as long
as you keep all of the "relative" concepts in mind. And using it will
confirm you have more than just a "radiating dummy load".
Note: Navy Ships "run" an antenna radiation pattern range after
significant extensive shipyard changes to the external ships
structure on each antenna mounted onboard. A minimal
calibrated power is placed on each antenna on several
frequencies the antenna is designed for. Then the ship turns
in a circle at sea at a pre-designated point while the shore
calibration station prints a circle chart that will result in a
visual indication of each antenna and several of its capable
frequencies radiation patterns. The final result usually looks
like a Porcipine. Some manufacturers, such as Boeing, can do
the same thing with their aircraft./ga

From: Ken
Topic: 27244 Message: 27244

I know !!, but has anyone blown receiver inputs with hf/6 144 with antennas too close.
Balcony is 6x9 feet. Have j-pole and want to install my SGC237/loop.
10 watts on 2, but worry if I can run 100 ssb (30 digital) on hf with out trouble.

27245. Re: Using Rig In Jeep Liberty - Aweful Noisy

From: cherokee_mule
Topic: 27050 Message: 27245

Thanks for the inquiry Scott. Below is the link to my original post, and I have included the actual text for your review:

---
http://groups.yahoo.com/group/FT897/message/27050

These past couple of weeks I have been working on installing my 897 in my Jeep Liberty Sport. The power leads run straight to the battery posts. The antenna is an ATAS-120. The mount is a K400. The radio is secured to the passenger seat. The antenna/mount is currently attached to the bottom lip of the rear hatch door.

On receive I pick up engine noise, and as I accellerate the noise becomes louder. I believe it is ignition noise because, 1) With the engine running I used a battery powered AM radio outside and in the rear of the Jeep with little noise, but received a lot of noise in the front seat area. 2) I pick up the same noise on the 897 in AM mode with antenna attached. 3) The 897 doesn't pick up any noise in AM mode when the engine is off. 4) There is no noise when the antenna is disconnected and the engine is on. 5) I connected the 897 directly to a second car battery, leaving the radio and antenna in/on the Jeep, and recived the same engine noise in AM mode while the engine was running.

Now for the weird results: 1) I first moved my antenna from the rear of the Jeep to the passenger side hood. A 45 minute drive into work resulted in little engine noise. The noise returned on the trip back home. 2) I used a 160W converter box, plugged into the cigarette lighter, to power the radio and received little noise on a 45 minute trip. After that the noise returned.

I am completely lost on what to do to eliminate the engine noise! Before starting this project I had to remove my 2meter radio and even had to clean the battery post due to the excessive corrosive buildup.

Could it be that my battery is not acting like a good capacitor and is needing replaced? Where do I go from here?

Thanks,

Deion "Mule" Christopher

I feel called upon to make two points.

I don't profess to be technically proficient, but I honestly was unable to make sense out of anything in your posting. My problem entirely, but if you want to rephrase it so I can understand what you are saying about field strength meters, I would truly appreciate it.

Not a doctor either, but did ask a doctor friend and he says he knows of no case where cataracts cured themselves without surgery. It is possible to clear up post-operative cloudiness without invasive surgery, but he assures me there is no such thing as spontaneous remission of cataracts.

Thanks for the response.

27247. Yaesu FT857/897 on satellites

Yahoo group: FT897 (2009)
Date: 2009-08-13 03:57:05 UTC
From: John Geiger
Topic: 27247 Message: 27247

Is anyone on the list using a Yaesu FT897 or FT857 on the LEO satellites (both FM and SSB)? I am currently using an Icom 706MKIIG with pretty good results, but have been thinking about "upgrading" to a Yaesu FT897D or maybe a FT857D. I have used some Yaesu rigs on the sats before and the 706MKIIG seems to hear them better, especially AO27.

I don't have a big setup-Cushcraft dualband yagi (5 elements on each band) with no elevation, so signals are not rockcrushing from the satellites. The QST reviews show that the Icom has better sensitivity on 70cm SSB (MDS of -143 vs -139 dbm) and on FM (.16 vs .21 microvolts) but are those differences really meaningful? Do the 897 and 857 still receive the sats really good with a minimal setup?

Hi Guys

Has anyone got any idea on how I can unlock the mode and band switching on the front panel.
Turned the radio on today and its gone a bit cranky!
even after full reset mode and band switching no operational.
And it's not the front panel lock or in the menu......
Any ideas???

Many tnx Billy 2E0ZWW

27249. Re: [FT897] No power on?????????????

Yahoo group: FT897 (2009)

From: Alan Bowring
Topic: 27221 Message: 27249

Hi Fred,
31 volts sounds pretty scary - the potential to do a lot of damage. If you are into opening up your set, here is the first place to look. Look at the PA Unit Circuit diagram, Page 59 in the Technical Supplement Manual. On the left of the diagram you see that external DC enters on the PA Unit board via a filter "T3001" and gets to the Power Switch Relay "RL3001" via a diode "D3005". This diode is labeled as "HV Protect", presumably protecting against a situation where the supplied voltage goes high. Check the electrical function of that diode with your meter as a starting point. I would be suspecting it my be open circuit. Check also the continuity of the relay RL3001 actuating coils and the function of Q3007 which is the transitor that actuates the relay coil. Q3004 - the 5V regulator could be checked at the same time. Also D3004 across the relay coil, although its voltage rating is probably high enough that it wouldn,t be affected. There are some electrolytics as you see in the diagram of about 16V rating that should be checked also in case they have been stressed. If this is more than you can handle or doesn't produce conclusive results, then its off to the repair shop.

Regards
Alan

Hi group,

My name is Jim King. I have had this here Yaesu radio for a couple of years and I'm still learning about it, something new almost every week. I use either a LDG Z-11 tuner or a MFJ 941E. I have a 2m magmount atop a home made tower. When I get out and about, I use a G5RV. with a 4:1/1:1 balun. Most of the time I setup in my popup trailer when I can go camping. On the car I have the ATAS 120.

My two favorite hobbys.

I came to this group to learn more about my radio and to meet a few new folks.

Thanks for listening.

27253. Re: [FT897] New HAM needs assistance ... :)

Yahoo group: FT897 (2009)
Date: 2009-08-13 21:57:56 UTC
From: Alan Bowring
Topic: 27220 Message: 27253

Hi,
I think you are going to be stuck with this hash/ interference and as you have already had suggested - investigate options of moving the antenna further away from building and use the transceivers noise filtering options to their max. I will just share of my own home experience. If you look at picture of my Carolina Windon on QRZ.com (ZL2AEB), the left side passes over top of the house roof where TV and freeview Satellite receiver are located inside. Satellite Receiver gave much hash that was only eliminated by additional power line filters inside its casing and the fitting of a 3 core power cable earthing its casing in replacement of its 2 core cable. An outdoor A/C unit also in that area produced varying levels of noise depending on its cycle. Opening its casing and fitting a handful of ferrite rings to various cables got rid of a lot of noise, but disconnecting the cable between outdoor and indoor unit and wrapping that in tin foil which was earthed to the outdoor metal frame and then driving an earth peg right by the outdoor unit was needed to deal to the last of the noise.
A computer tower case also produced a lot of noise - replacement of its power supply, although not faulty eliminated that noise. Computer screens were the another so I got rid of 2 CRT screens and replaced them with LCD and not using their switch mode power supplies, made up linear power supplies for them. Power saver light bulbs was another, they become faulty but still go and produce a very broad range hash. Also a computer scanner power supply had gone faulty - still working but producing hash.
The point of all this - all of these types of equipment are present many times over in a high rise apartment building and so you are probably fighting a loosing battle to try to trace let alone change any of it to eliminate the noise. Another one I am told is the Plasma TVs that produce a lot of noise. I haven't had experience with those but you may well have them near by as well. As stated work on getting your antenna as far away from the noise sources as you possibly can, then use all your noise filtering options.

Subject: [FT897] New HAM needs assistance ... :)

Hi,

I am a new HAM. I just obtained the following :

1) Yaesu FT-897D
2) MFJ 949E
3) MFJ 1622

Well, I live in a high-rise apartment, therefore I purchased the MFJ 1622.

The problem I am having is that I am getting a lot of noise. My S-meter level, if that is correct is always around S7 to S9.

I just keep on hearing lots of noise and I can't seem the tune my antenna down to a SWR of less than 2:1. I am just getting 2.5:1.

I had attached 2 counterpoise wires to the MFJ-1622 but it doesn't seem to help much.

I am trying to get on 20m and 40m.

I would appreciate any advise.

Thanks :)

Hi Guys,

Thanks for all the responses.

I am going to try out all the filtering functions available on the FT-897D and see if I can get any better results :) ...

Eh.. that portion on the RF causing possible medical problems is sort of freaking me out. Is anyone able to provide more information on it ?

I know the default setting for RF output is 100W. I have tuned it down to 30W for setup purposes.

Is that alright ?

27256. VFO/Mem ch - Hard to press

Yahoo group: FT897 (2009)
Date: 2009-08-14 13:54:58 UTC
From: finnigann2580
Topic: 27256 Message: 27256

According to the manual, the VFO/Mem ch knob/button is to be pressed to activate certain functions. I am having a difficult time getting the button pressed hard enough.

Sometimes it helps to press at an angle, sometimes not. I can press very hard and get mixed results. Sometimes pressing for a long time will do it, and sometimes not.

Does this sound familar? What can I do about it? I have written to Yaesu but have not heard back yet (about a week at this time).

27257. Re: [FT897] Re: separating RX/TX lines for 2m ?

Yahoo group: FT897 (2009)
Date: 2009-08-13 11:27:05 UTC
From: Alan Bowring
Topic: 27188 Message: 27257

Hi Mike,

I have just been looking at the FT897 circuits to check the feasability of what you want to do. You can search for and download the FT-897 Technical Supplement for yourself if you like. Page 59 shows the PA Unit circuit where changes would have to be made. There are in fact 14 relays that work in pairs for the different bands that are covered. There are no coax cables you can simply unplug - this will be all printed circuit lines to and from the relays. To do what you propose would involve major surgery and alteration on the PA Unit board and and include the designing of additional matching circuits to match the coax to the points where it would have to be grafted in. This would be serious Experienced Radio Electronic Designer/Technician stuff. Not easy feasable or cost effective for someone without that experience. You are well advised to acheive what you want by the use of equipment external to the transceiver.

I imagine, without opening my unit, that there are unique RF cable that go
from both the receiver and the transmitter to a T/R relay somewhere. I
would just pull the receiver one off and add an external connector.

Hi Mike,
of course I use right now a sequencer and a Preamp with coax relays.
I'm asking for a mode separating TRX lines because of using a low noise LNA
without switching relays.Therefore separating lines is needed.

Hi again Fred,
a couple of points I missed to check which are the HV Protect - D3006 a zener diode, to make sure in particular that it is not short circuited and Q3010 to make sure in particular that it is not shorted C-E. Any one of those will prevent the rig working.
Out of curiosity, what was the power supply that you were using that went high voltage?

Hi Guys

A strange thing has happened to my 897, I turned it on yesterday and noticed a change right away, the screen colour had changed. Not such a great problem, but on closer inspection I have no band, or mode operation on the panel, and worse still no TX!
I still have RX and vfo control via the main tuning dial.
I have done every possible reset as directed by the distructions and the net but no change!

As i run digital 99% of the time I thought there might have been a bad instruction sent via cat, resulting in the lock up.
I have removed all conections to the radio back panel.
Even under full reset this has had no effect.

I am now just scratching my head, so if anyone has any ideas.....

Many tnx Billy 2E0ZWW

Hi,

Thanks for all the replies ... I am going to try this weekend to sort this out. I am living on 8th floor and I am trying to setup my equipment in another room away from my computer and TV, as far as I can. I hope that helps.

Thank you for this. Question: just how much attenuation does roof mounting provide? Can you give some perspective on this?

We've done other tests with ATAS antennas mounted on the bonnet of a car, or beside a rear window. These radiate little from the coil, but lots from the whip. Mounted on the rear edge of the bonnet, and the top of the steering wheel is around 50 to 60V/m. It's quite easy for a rear bumper mount to be potentially damaging passengers, many don't carry passengers in the back, but consider the family man with children in the back, best to keep such antennas up on the roof.

I used FT-897D for satellite. No preamplifier. No amplifier
AO-51 is correctly received signal 40/52 with my station.
I used VHF and UHF 9 elements beam vertical position with az/elev
rotator G-5500.
The software HamRadioDeluxe drives the transceivers.

One thing that I see most have overlooked or failed to mention. You live in an area where the electric draw is VERY HIGH. Not to mention that I would figure there is some "industrial" type power consumption nearby as well (office bldg, shops, shopping center/strip mall maybe). These WILL produce a HIGH level of noise/interference that you will NOT be able to get rid of, unfortunately. Try the filtering, etc., but do not be too disappointed if you can't get but a little result.

But still, good luck!

OK will try to keep it simple.

When measuring field strengths, you get good stable readings if you are a good distance away from the antenna - outside the near field.

Your antenna radiates a signal as you know, this produces a magnetic field, and an electrical field, we call them H and E fields, both of which can cause harm. There is a relationship between these two which is based on the impedance of the space, which is not constant and varies for each close to the antenna, so close to the antenna it is highly unpredictable, or very complicated to predict. If you measure a low E field, the H field could be massive or vice versa. So a simple measurement of the E field in v/m could be misleading, this being why commercial measurements close to the antenna measure the power per meter cubed. (Note this is a simple analogy and not quite correct)

When you get out of the 'near field' into 'free space' things stabilize and the impedance of free space becomes virtually a constant, so an E field measurement is useable. We usually consider we are in the near field if we are closer than one wavelength from the antenna, if you're on 160m, that's well outside your house at least well outside most people's houses.

This also becomes relevant when hams moan a piece of electrical kit is causing them interference and shouldn't be allowed on the market. Simple EMC legal requirements need measurements to be taken above about 50MHz, but not below because below ones laboratory has to be massive to get out of the near field where simple useable measurements can be made.

Now to the cataract bit, an my PhD isn't medical, it's comms. The condition we found with a local ham was NOT cataract, you are correct here, it does not cure itself, but the eyes looked milky like cataract. I did not have the opportunity to examine the ham with the problem, the milky eye, we assume the condition was tissue damage to the conjunctiva rather than cataract which occurs on the lens, others that did know him at the time say it wasn't just the lens that was milky, but the whole front of the eye. I am not qualified to say really, just observe and relate for others to conclude. It started when he used his radio close to his antenna, and went away after about 6 months when he stopped using the radio, cataract won't do that so it's some other condition. The point is though that I'd rather not have any one else suffering from it.

I hope that helps.

I feel called upon to make two points.

I don't profess to be technically proficient, but I honestly was unable to make sense out of anything in your posting. My problem entirely, but if you want to rephrase it so I can understand what you are saying about field strength meters, I would truly appreciate it.

Not a doctor either, but did ask a doctor friend and he says he knows of no case where cataracts cured themselves without surgery. It is possible to clear up post-operative cloudiness without invasive surgery, but he assures me there is no such thing as spontaneous remission of cataracts.

Thanks for the response.

your tuner is fine. It is a very narrow tuner. You must have the antenna almost resonent and than the tuner will "touch up" or fine tune. It is not a very good tuner. I have one that I even sent back and told them it didnt work. I now use it for a book end. Do yourself a favor and if you want a nice wide band tuner that WILL tune antennas get the LDG for the 897. Much much better one. Yaesu is a great product but they fell short with the FC30. Read the eham reviews on the FC30 and also check the past posts here a lot has been discussed about it.

27268. Re: separating TX RX lines on 2M

Yahoo group: FT897 (2009)
Date: 2009-08-15 11:27:59 UTC
From: Dave Nelson
Topic: 27268 Message: 27268

Hi guys,

actually NONE of those relays are used on 2m/70cm for antenna switching
they are all for the HF and 6M bands

the 2m and 70cm bands are switched via PIN diodes in the output of the V/UHF
transmitter (keep in mind that V/UHF uses the same output transistor !!)
and if you disable the pin diodes for RX on 2M you are going to do the same
for the the 70cm RX

after the output TX amp the circuit is split to go through separate 2m and 70cm
LPF's then recombined in D3050 to pass to the main board as a common RX line
Playing around in there if you are not careful will seriously upset the
biasing for the TX/RX PIN switching diodes ... NOT something I would
recommend.

Proceed with extreme caution :)

cheers
Dave

Topic: 27266 Message: 27269

Thank you for the RF for Dummies version. As things stand, I use a screwdriver antenna (Super Antenna) mounted on a tripod in front of a window and a counterpoise (cut quarter-wave for 20 meters) hanging out the window.

The only thing I can measure is what the field strength meter shows for the area around the antenna, with spot readings taken around the room and in the hallway outside the room. No signs of high readings. I am assuming there is little or no RF being given off by the counterpoise.

For safety sake, the antenna is in the main bedroom, separated from the rig by the bathroom. Two study walls, built in the 1920s, plus space inside each bedroom and inside the bathroom, separate me from the antenna when I broadcast.

Hi Mike,

I have just been looking at the FT897 circuits to check the feasability of what you want to do. You can search for and download the FT-897 Technical Supplement for yourself if you like. Page 59 shows the PA Unit circuit where changes would have to be made. There are in fact 14 relays that work in pairs for the different bands that are covered. There are no coax cables you can simply unplug - this will be all printed circuit lines to and from the relays. To do what you propose would involve major surgery and alteration on the PA Unit board and and include the designing of additional matching circuits to match the coax to the points where it would have to be grafted in. This would be serious Experienced Radio Electronic Designer/Technician stuff. Not easy feasable or cost effective for someone without that experience. You are well advised to acheive what you want by the use of equipment external to the transceiver.

Regards
Alan

I imagine, without opening my unit, that there are unique RF cable that go
from both the receiver and the transmitter to a T/R relay somewhere. I
would just pull the receiver one off and add an external connector.

Hi Mike,
of course I use right now a sequencer and a Preamp with coax relays.
I'm asking for a mode separating TRX lines because of using a low noise LNA
without switching relays.Therefore separating lines is needed.

Hi dear Ronald,
TNX for your answer. That was the thing I was looking for !
Didn't expected but hoped it was so easy. In your post I see
you understand the problem with LNA/QRO.
Is it possible you make a pictured advice (sure on own risk) from
your mod ? Guess lot's of 2m enthusiasts will give you a big THANKS.
If you need to contact me pse dk5ew@... or via my homepage at
http://www.qslnet.de/member/dk5ew/

27272. Re: Yaseu FC-30 Tuner

Yahoo group: FT897 (2009)
Date: 2009-08-15 21:20:47 UTC
From: Jim
Topic: 27250 Message: 27272

The FC30 tuner can be "Fudged" to work over a greater range by opening the 897's swr limits a little. This was done on one of the earlier rigs (857?) to allow the tuner to tune a broader expanse of SWR.
I don't see why the FC-30 tuner could be persuaded to tune to a broader response. Perhaps just no one has tried it due to the availability of the other mentioned tuner. I haven't read of any attempts or comments on reworking the FC-30.

> your tuner is fine. It is a very narrow tuner. You must have the antenna almost resonent and than the tuner will "touch up" or fine tune. It is not a very good tuner. I have one that I even sent back and told them it didnt work. I now use it for a book end. Do yourself a favor and if you want a nice wide band tuner that WILL tune antennas get the LDG for the 897. Much much better one. Yaesu is a great product but they fell short with the FC30. Read the eham reviews on the FC30 and also check the past posts here a lot has been discussed about it.

I think you are probably far enough away to not worry.

When I get worried is someone sitting in a one roomed bedsit, rig on one end of the bed, and antenna bolted to the other end. Sort of common students or elderly caravan/park home situation.

Thank you for the RF for Dummies version. As things stand, I use a screwdriver antenna (Super Antenna) mounted on a tripod in front of a window and a counterpoise (cut quarter-wave for 20 meters) hanging out the window.

The only thing I can measure is what the field strength meter shows for the area around the antenna, with spot readings taken around the room and in the hallway outside the room. No signs of high readings. I am assuming there is little or no RF being given off by the counterpoise.

For safety sake, the antenna is in the main bedroom, separated from the rig by the bathroom. Two study walls, built in the 1920s, plus space inside each bedroom and inside the bathroom, separate me from the antenna when I broadcast.

27274. Noise from OEM Battery charger

Yahoo group: FT897 (2009)
Date: 2009-08-16 02:22:07 UTC
From: kc9ipv
Topic: 27274 Message: 27274

Anyone have any issues charging one battery while using the other?

On the 17 meter band the OEM charger gives me a S7 to S8 noise level making the band useless while charging. Does anyone else have this problem?

I had a friend with a W4RT charger try it and he has no noise.

Mike KC9IPV

27275. Re: New HAM needs assistance ... :)

Hi Mark,

I am sort of in this setup though. I have my rig radio setup on a small study desk at one end of the room and the antenna bolted onto my balcony.

The distance is only around 2 meters. It is after all a balcony/window antenna.

OK

I doubt whether you can safely run anything close to 100W with most setups. Your down to the distance which is usually always considered a no go zone, unless the power is down to the sort of levels of a handy sort of 5 to 10w max. 2 meters though is massively better than 2 feet.

I haven't followed all the posts, so I'm not sure what antenna you have bolted on the balcony am hoping a screwdriver antenna is a good bet.

With these there's little radiation below the coil antenna junction, so if you can mount it so that junction is above head height you should be OK to run lots of power. Things like the Atas come with recommendations regarding safety which I believe are to keep the public quite a distance away in the order of a couple of meters I think - easy enough to look up, and you may just fit that recommendation to get away with running 100w.

I also see magnetic tuned antenna's used in small spaces, because they are small, these are the ones with a big loop and various tuning arrangements at the base to make them resonant. Most you'll find have a motor drive in the tuner, and there's one good reason for this, it's because it's too dangerous to strand in close and tune it. Without the motor it's easy to get RF burns while trying to tune, These are thus not ideal for you, unless you are perhaps side on.

Another thing you could try is trying to spread an antenna across the building and gain some gain from a bigger antenna so you spread the radiated field over a larger area. It may be possible for you to get a line up to the roof or a gutter and use that to pull a wire antenna. I've also seen wire collinear antennas made from coax thrown down from balconies.

And the last method to help is to try and get something directional, and then not stand in front or behind it, would work well for 2m but not so easy to HF. Some 2m beams have gains that are very high and can cause harm several meters in front of them, and HF beam is usually so big you can't get in front of it.

Really you're in a very difficult situation, one I wouldn't like to be in, and one it is difficult to make any proper recommendation without properly analysing the space you sit in during a transmission. I think the screwdriver antenna is the best option since the manufacturer gives safe distances as I've said above.

I hope that helps, but please be careful. Mild RF burning will cause things like stiff muscles where the tissue gets slightly cooked inside. You don't feel pain because there are no pain receptors there. With heavy RF burns, the tissue warms up deep inside then the heat is conducted to outer tissue

where you feel it, let go, but the cooking and pain continues for a while like a microwave. Then over the next few days the tissue will go hard and tendons and muscles don't seem to be as flexible as they were. In my youth I've experienced this first hand.

Hi Mark,

I am sort of in this setup though. I have my rig radio setup on a small study desk at one end of the room and the antenna bolted onto my balcony.

The distance is only around 2 meters. It is after all a balcony/window antenna.

Hi Mark,

Thanks.

I am using the MFJ 1622 antenna. I suppose that is a screwdriver antenna ?

Well, I guess if it is too dangerous, I may have to halt this for the time being. I have no idea how to measure the safety of this at all.

OK

I doubt whether you can safely run anything close to 100W with most setups. Your down to the distance which is usually always considered a no go zone, unless the power is down to the sort of levels of a handy sort of 5 to 10w max. 2 meters though is massively better than 2 feet.

I haven't followed all the posts, so I'm not sure what antenna you have bolted on the balcony am hoping a screwdriver antenna is a good bet.

With these there's little radiation below the coil antenna junction, so if you can mount it so that junction is above head height you should be OK to run lots of power. Things like the Atas come with recommendations regarding safety which I believe are to keep the public quite a distance away in the order of a couple of meters I think - easy enough to look up, and you may just fit that recommendation to get away with running 100w.

I also see magnetic tuned antenna's used in small spaces, because they are small, these are the ones with a big loop and various tuning arrangements at the base to make them resonant. Most you'll find have a motor drive in the tuner, and there's one good reason for this, it's because it's too dangerous to strand in close and tune it. Without the motor it's easy to get RF burns while trying to tune, These are thus not ideal for you, unless you are perhaps side on.

Another thing you could try is trying to spread an antenna across the building and gain some gain from a bigger antenna so you spread the radiated field over a larger area. It may be possible for you to get a line up to the roof or a gutter and use that to pull a wire antenna. I've also seen wire collinear antennas made from coax thrown down from balconies.

And the last method to help is to try and get something directional, and then not stand in front or behind it, would work well for 2m but not so easy

to HF. Some 2m beams have gains that are very high and can cause harm several meters in front of them, and HF beam is usually so big you can't get in front of it.

Really you're in a very difficult situation, one I wouldn't like to be in, and one it is difficult to make any proper recommendation without properly analysing the space you sit in during a transmission. I think the screwdriver antenna is the best option since the manufacturer gives safe distances as I've said above.

I hope that helps, but please be careful. Mild RF burning will cause things like stiff muscles where the tissue gets slightly cooked inside. You don't feel pain because there are no pain receptors there. With heavy RF burns, the tissue warms up deep inside then the heat is conducted to outer tissue where you feel it, let go, but the cooking and pain continues for a while like a microwave. Then over the next few days the tissue will go hard and tendons and muscles don't seem to be as flexible as they were. In my youth I've experienced this first hand.

I'm joining this late so apologies if it's been said:

You can do a fair amount at low power. I use an outdoor antenna which helps, but I hear of people using indoor loops and similar at QRP levels and doing well with them.

Agreed. The FC30 is a really weak sister to the LDG897. I just wish it was more rugged.

your tuner is fine. It is a very narrow tuner. You must have the antenna almost resonent and than the tuner will "touch up" or fine tune. It is not a very good tuner. I have one that I even sent back and told them it didnt work. I now use it for a book end. Do yourself a favor and if you want a nice wide band tuner that WILL tune antennas get the LDG for the 897. Much much better one. Yaesu is a great product but they fell short with the FC30. Read the eham reviews on the FC30 and also check the past posts here a lot has been discussed about it.

Many Thanks for the help, it's off to Castle Electronics, hope it's not to dear to be rapaired but I cant see the board never mind the components!!! I've decided how much the radio is worth to me and how much i'm willing to spend before i sell it as spares!
Again Thanks
Fred

The MFJ 1622 was designed as an apartment antenna.

I would expect you are probably reasonably OK at 2m distance, and try to put it as hi as possible, so if you can put a pole onto the balcony to get the coil above head height that would probably help, though we don't really know the vertical radiation pattern.

MFJ say though it's good for use on desks and the like, implying operators very close in to the antenna, I also hope that means they have conducted some tests close in, not to do so might open the doors to a flood of legal issues.

The instructions are a little vague, lots of legal warnings, 'serious rf burns' etc, and warnings to keep away from power lines and metal window frames, nothing regarding safe operator distances.

The danger is a difficult thing to guess, there are many things that might be dangerous yet are OK, judging the risk in issues like this is very difficult, I like to air on the safer side especially with RF that you can't see, but you can't always do that and sometimes have to work on the fringe or into the unknown. We have the safety recommendations, many people have exceeded these many times without any issue. Things like mobile phones have been allowed to break these. You'll love this one. Some mobiles can produce 60V/m close in, that's above recommended levels, but at 10cm away the level has fallen just inside safe levels, so they say that when it's against your ear, it's 10cm away from anything that could cause harm!!!. Must mean they have one brain cell in the middle, and a very big head. However we all use them, and it's rare you'll hear anyone with a problem, and that's usually psychological.

I think if I were you I would email or phone MFJ for some recommendations, as far as I'm aware people sue the hell out of each other for just about anything in the USA, so I would have thought they would have considered this issue. they should really know their antenna. If they know you are 2m away, they should be able to recommend a safe power for each band. Let us all know what they come back with.

Hi Mark,

Thanks.

I am using the MFJ 1622 antenna. I suppose that is a screwdriver antenna ?

Well, I guess if it is too dangerous, I may have to halt this for the time being. I have no idea how to measure the safety of this at all.

Subject: RE: [FT897] Re: New HAM needs assistance ... :)

OK

I doubt whether you can safely run anything close to 100W with most setups. Your down to the distance which is usually always considered a no go zone, unless the power is down to the sort of levels of a handy sort of 5 to 10w max. 2 meters though is massively better than 2 feet.

I haven't followed all the posts, so I'm not sure what antenna you have bolted on the balcony am hoping a screwdriver antenna is a good bet.

With these there's little radiation below the coil antenna junction, so if you can mount it so that junction is above head height you should be OK to run lots of power. Things like the Atas come with recommendations regarding safety which I believe are to keep the public quite a distance away in the order of a couple of meters I think - easy enough to look up, and you may just fit that recommendation to get away with running 100w.

I also see magnetic tuned antenna's used in small spaces, because they are small, these are the ones with a big loop and various tuning arrangements at the base to make them resonant. Most you'll find have a motor drive in the tuner, and there's one good reason for this, it's because it's too dangerous to strand in close and tune it. Without the motor it's easy to get RF burns while trying to tune, These are thus not ideal for you, unless you are perhaps side on.

Another thing you could try is trying to spread an antenna across the building and gain some gain from a bigger antenna so you spread the radiated field over a larger area. It may be possible for you to get a line up to the roof or a gutter and use that to pull a wire antenna. I've also seen wire

collinear antennas made from coax thrown down from balconies.

And the last method to help is to try and get something directional, and then not stand in front or behind it, would work well for 2m but not so easy to HF. Some 2m beams have gains that are very high and can cause harm several meters in front of them, and HF beam is usually so big you can't get in front of it.

Really you're in a very difficult situation, one I wouldn't like to be in, and one it is difficult to make any proper recommendation without properly analysing the space you sit in during a transmission. I think the screwdriver antenna is the best option since the manufacturer gives safe distances as I've said above.

I hope that helps, but please be careful. Mild RF burning will cause things like stiff muscles where the tissue gets slightly cooked inside. You don't feel pain because there are no pain receptors there. With heavy RF burns, the tissue warms up deep inside then the heat is conducted to outer tissue where you feel it, let go, but the cooking and pain continues for a while like a microwave. Then over the next few days the tissue will go hard and tendons and muscles don't seem to be as flexible as they were. In my youth I've experienced this first hand.

Hi Mark,

I am sort of in this setup though. I have my rig radio setup on a small study desk at one end of the room and the antenna bolted onto my balcony.

The distance is only around 2 meters. It is after all a balcony/window antenna.

Topic: 27250 Message: 27283

If you follow the instruction in the manual to the letter it should work. Have you checked with an analyzer to see if the antenna will tune. The FC-30 has a limited rage; it will not tune a 20:1. As the party has already mentioned it is more of a finisher than what most people think of as a tuner. I would forget the idea of a fancy "tuner". Get a good antenna that just needs touching up. Tuners waste a lot of RF power. By the way most mobile antennas have limited tuning range. As far as I know there are no "G5RV" mobile antennas. If you want good mobile contacts use separate ham sticks for the different frequencies and tune them before you use them. My philosophy is that the second piece of equipment that you buy after a radio is a analyzer

> > thanks charlie
> >
> ----------
>
> your tuner is fine. It is a very narrow tuner. You must have the antenna almost resonent and than the tuner will "touch up" or fine tune. It is not a very good tuner. I have one that I even sent back and told them it didnt work. I now use it for a book end. Do yourself a favor and if you want a nice wide band tuner that WILL tune antennas get the LDG for the 897. Much much better one. Yaesu is a great product but they fell short with the FC30. Read the eham reviews on the FC30 and also check the past posts here a lot has been discussed about it.

>> ... Well, I guess if it is too dangerous, I may have to halt this for the time being. I have no idea how to measure the safety of this at all. <<

In the US, the FCC establishes Maximum Permissible Exposure guidelines for RF. Knowledge and application of these guidelines in the field is expected of US amateurs. In his license exam preparation books, Gordon West publishes a table derived from these guidelines. The table gives a minimum acceptable distance from the antenna given the transmit frequency band, peak envelope power, antenna gain, and whether the environment is "controlled" (e.g., you and your family) or "uncontrolled" (e.g., neighbors or passers-by). But the table is a worst-case scenario, as it assumes no feed-line loss and 100% duty cycle (in effect, an emission type like PSK31 transmitting all the time), so you have to adjust for reality.

The ARRL has a Web page on this subject with many links to other documents, including resources discussing RF safety outside the context of the FCC regulation:

Thanks John

I knew I had seen something by the ARRL, but couldn't lay my hand on it.

At least they try to teach you guy's something over there, in the UK this important issue tends to get side stepped by the RSGB and Ofcom.

I've taken a quick glance though and it looks like if you are under 500W on 160m, you don't need to do an assessment, however 500W with an operator close to the antenna is probably going to do some harm, though at lower frequencies there are military tests which say you are OK with lots of power, and world health documents that contradict this. Doesn't bode well for a confused worried ham.

If I get chance I'll try to look it over some more this evening.

27324. MODERATOR MESSAGE: Marine Use

Yahoo group: FT897 (2009)
Date: 2009-08-18 18:12:28 UTC
From: w4wb
Topic: 27324 Message: 27324

Folks,

This thread is to be terminated. Discussions are to be upon the legal usage of the FT-897/D. To be clear, this radio and others for amateur usage are not type certified for marine or commercial usage.

I don't know about the rest, but I do know that the squelch can still
flicker. On a couple of 2M frequencies, I still get a nasty bounce on
the squelch...I have to turn it up higher than I should, making it
likely I'd miss weaker calls.

Yes indeed I encountered the same high level noise on all the hf bands while charging one bat. and operating on the other bat. I was using the Yaesu wall charger that plugs into the cd-24 controller. I tried it also on vhf/uhf fm and don't hear any noise.
I would like to use a solar panel to charge one bat. while operating on the other bat. on the hf band for portable ops. I would like to know if the panel also generate noise in this configuration? Has anyone tried this to confirm whether it is workable or not?

27340. Re: Noise from OEM Battery charger

Yahoo group: FT897 (2009)
Date: 2009-08-18 22:12:37 UTC
From: k5btk
Topic: 27274 Message: 27340

Yes! My Yaesu battery charger kicks up a lot of hash across most of the HF spectrum. Some bands are noisier than others. Twenty meters (my favorite band) becomes unusable on my regular station when I'm recharging a battery.
BUT - at times the noise can be handy. When the batteries get a few years on them, they don't seem to like to take a full recharge on the first attempt. The charging process terminates sometimes after only a few minutes. Allowing the battery to "rest" a few minutes and then reconnecting it to the charger will resume the charge. I sometimes have to do this several times to fully recharge the battery. The problem is KNOWING when the process has terminated each time so that I can keep up with the CUMULATIVE charging time. Rather than sitting there looking at the charger so I'll know when the red charging light goes off, I tune the station receiver to 20 meters and turn up the volume level so that I can hear it two rooms away where I'm reading. When the noise level suddenly drops, it catches my attention and I write down the time at which the charger switched off. I wait 20 minutes or so and start again.
Of course after doing this for a while you get tired of the hassle and shell out the $$$ for a new battery! ...Don (K5BTK)

Thanks for the reply Don. It's a hassle for me since I use mine portable and would like to charge one with a solar panel while using the other. The documentation even states you can do that! My guess they didn't test it. I have a friend with the w4rt charger and he doesn't have that problem. I emailed yaesu and they told me to put RFI beads on the line. After putting 6 on there it helped but its not gone.

To program your rig, rather than just remote-control it, you need something like this: http://www.g4hfq.co.uk/ftbasic.html

It's $15, but well worth it. I don't know of any freeware apps for programming the 897 (or any of Yaesu's other base/mobile rigs, for that matter.)

Also, none of the remote-control apps that I've found can do things like set the PL tone or repeater offset. They're pretty useless for anything but HF work. That's not the fault of the app developers; the problem is that the FT-897 just doesn't have CAT commands to change those settings. There's not even a documented CAT command for selecting a memory entry.

Ham Radio Deluxe comes the closest to full control: it uses undocumented CAT commands to write many of the settings; it can control power levels, but it still can't really be used for repeater work. You'll need to store repeater channels in memory with FTBasic if you're going to work them. (HRD works great for HF, though. I love being able to quickly set the power levels and run the radio from the larger control surface of my computer monitor.)

27347. RE: [FT897] Soft ware

Yahoo group: FT897 (2009)
Date: 2009-08-19 02:35:20 UTC
From: Dave AA6YQ
Topic: 27326 Message: 27347

Be aware that those undocumented commands -- like setting RF output level -- require writing to the FT-897's EEPROM. There are two problems with this: EEPROM locations can only be written a finite number of times before they literally wear out (I don't have the part # for the EEPROM used by Yaesu and so don't know what that limit is), and a data error can generate a write to the wrong EEPROM address, which can convert your FT-897 to a paperweight. The discovery of undocumented commands for the FT-817 was accomplished by Clint KA7OEI; see

<http://www.ka7oei.com/ft817_meow.html>

These commands are also available on the FT-857 and FT897. To quote Clint,

"Command BC - Write EEPROM Data: ... Note that careless use of this command can cause the FT-817's CPU to crash and/or cause a complete wipe of all EEPROM data including configuration, software calibration/alignment, and memories - the effect being similar to that of the "Reset to Factory Defaults" command (below!) If you insist on using this command without first recording the 76 "soft calibration" settings and noting what is in your radio's memories, you are an idiot! (Am I clear on this point?)"

Commander, the transceiver control component of the freeware DXLab Suite, provides sliders that can be configured to control the FT-897's power output and other settings by generating CAT commands that write to the transceiver's EEPROM -- but I recommend against doing this.

73,

Dave, AA6YQ

27351. Re: [FT897] Soft ware

Yahoo group: FT897 (2009)
Date: 2009-08-19 10:46:45 UTC
From: Darren S
Topic: 27326 Message: 27351

Don't worry. I'm not an idiot. One of the first tools I am writing is a tool to backup the calibration settings and memories.

One thing that you didn't mention about command BC is that it writes two bytes and not one so the best stratagy is to read two bytes into memory starting at the one you want to change, alter the one you want to change then write the memories back. that way you have little risk of writing a zero into something critical.
also back up what you read.

From: Dave AA6YQ <aa6yq@...>
To: FT897@yahoogroups.com

Subject: RE: [FT897] Soft ware

Be aware that those undocumented commands -- like setting RF output level -- require writing to the FT-897's EEPROM. There are two problems with this: EEPROM locations can only be written a finite number of times before they literally wear out (I don't have the part # for the EEPROM used by Yaesu and so don't know what that limit is), and a data error can generate a write to the wrong EEPROM address, which can convert your FT-897 to a paperweight. The discovery of undocumented commands for the FT-817 was accomplished by Clint KA7OEI; see

<http://www.ka7oei. com/ft817_ meow.html>

These commands are also available on the FT-857 and FT897. To quote Clint,

"Command BC - Write EEPROM Data: ... Note that careless use of this command can cause the FT-817's CPU to crash and/or cause a complete wipe of all EEPROM data including configuration, software calibration/ alignment, and memories - the effect being similar to that of the "Reset to Factory Defaults" command (below!) If you insist on using this command without first recording the 76 "soft calibration" settings and noting what is in your radio's memories, you are an idiot! (Am I clear on this point?)"

Commander, the transceiver control component of the freeware DXLab Suite, provides sliders that can be configured to control the FT-897's power output and other settings by generating CAT commands that write to the transceiver' s EEPROM -- but I recommend against doing this.

73,

Dave, AA6YQ

Subject: Re: [FT897] Soft ware

To program your rig, rather than just remote-control it, you need
something like this: http://www.g4hfq. co.uk/ftbasic. html

It's $15, but well worth it. I don't know of any freeware apps for
programming the 897 (or any of Yaesu's other base/mobile rigs, for
that matter.)

Also, none of the remote-control apps that I've found can do things
like set the PL tone or repeater offset. They're pretty useless for
anything but HF work. That's not the fault of the app developers; the
problem is that the FT-897 just doesn't have CAT commands to change
those settings. There's not even a documented CAT command for
selecting a memory entry.

Ham Radio Deluxe comes the closest to full control: it uses
undocumented CAT commands to write many of the settings; it can
control power levels, but it still can't really be used for repeater
work. You'll need to store repeater channels in memory with FTBasic if
you're going to work them. (HRD works great for HF, though. I love
being able to quickly set the power levels and run the radio from the
larger control surface of my computer monitor.)

Yes, the same noise is there when using a solar panel. So, the noise is from the cd-24 not the power source. I did get the noise down by putting 6 RFI beads on the line out of the charger. It's still there but no where near as bad.

Ditch the CD-24 and get W4RT's OneFastCharger (OFC). 0 noise from the grid or solar power.

From: Dave AA6YQ
Topic: 27326 Message: 27354

The "idiot" appellation was Clint's,not mine.

The risk to users comes not from incorrect programming in the CAT application, but rather from a serial port glitch (e.g. from RFI) that transforms a correct EEPROM address into an incorrect EEPROM address -- converting a write operation that updates the RF power output level to one that bricks the transceiver, for example. Its true that any valid CAT instruction could be corrupted into one that renders the transceiver unusable, but the odds of this happening are significantly greater when CAT commands that write to the EEPROM are frequently used.

From: kc9ipv
Topic: 27274 Message: 27360

That may be what I end up doing. However the CD-24 runs cool and doesn't have any case vents. It doesn't hurt to get a little moisture on it. The W4RT unit is not sealed at all.

I opened up the CD-24 this evening and put it on the scope and was amazed at just how dirty the output really is. It also seems to be way over engineered for a charger. I'm going to try to add some filtering inside the case and see if I can clean it up. I emailed yaesu for the schematic but I'm not holding my breath. They give you the one with the radio why not the accessories?

You do not get idiotic people, just idiotic decisions. :)

On a website I saw that each memory location in an eeprom can be written to about a million times. The chance of doing that in the lifetime is remote. it's more likely that the 897 will wear out before its eeprom does. I know somebody who bricked his 70cm by poking a 0 in the wrong place and it made 70cm deaf. That was fixed with a sig gen and a tap into the service menus and contrary to some beleif, doing a factory reset does not affect the service menu settings.

27362. MODERATOR MESSAGE: Please Read - Extend Tx range to cover 3.5 to 30 MHz

Yahoo group: FT897 (2009)
Date: 2009-08-20 02:07:16 UTC
From: w4wb
Topic: 27362 Message: 27362

Folks,

I repeat that the FT-897 is not type certified for non-amateur bands operation (MARS/CAP exception). Discussion of using the FT-897 as a backup or alternative to commercial gear is not appropriate on this forum. If you don't understand what this means, please recall that amateur radio is the experimental radio service of the Government (in the USA anyway). Consequently, the performance requirements of amateur radios are often inferior (because we are experimental) to commercial radios, and amateur radios can cause undesired interference on the commercial channels.

Please do not bring up this subject again.

Tnx es 73 de Barry W4WB

You might want to try the utility (modify.zip) that is in the files section of this group. It allows you to save all the unique service menu settings for your 857/897 to a small file on your PC. Should the unique settings in your radio become corrupt somehow, you can easily restore the original factory settings by uploading the service menu configuration that you saved in the file. It works like a charm.

When you look at PIC microcontrollers you see that there are two types of EEPROM in the package. The main program area does have limited write cycles, but it is still a huge number. If you use a single PIC for prototyping you will eventually wear it out. The area used for runtime configuration can withstand a lot more use and is highly unlikely to wear out .

Looking around the PIC 16F873 will expect to give 100,000 write cycles for its program memory and 1,000,000 cycles to its data EEPROM. I think some may do better now.

There is no parity or error checking on the CAT interface. There are just lots of stop bits. I've found it reliable so far. I've only been using it for normal operation, frequency checking and such. You'd not be transmitting while running any code to change the EEPROM which should reduce the chance of interference. It does sound a little scary though.

27372. AGC mod to FT-897 - anyone done it?

Yahoo group: FT897 (2009)
Date: 2009-08-20 09:55:16 UTC
From: DavidN
Topic: 27372 Message: 27372

I've quite recently purchased an FT-897 and am just looking through DG2IAQ's list of mods, dated Dec.2004.

He mentions the slow AGC is too fast. Myself, I find it OK, but just wondered if anyone had thought the same but had tried the mod anyway (you just add a 10uF capacitor). If so, I'd be interested in their constructive views on the mod....

David G4TUP.

From: Dr Mark Vaughan
Topic: 27372 Message: 27373

I think there's an AGC mod, and a Squelch Mod, been a while since I looked.

I have both on my 857D and they make a lot of difference when driving as signals vary massively.

The squelch mod really helps, otherwise on 2m it patters in and out as you drive down the road making the XYL complain. A DSP speaker also makes a lot of difference, silencing the background noise if your HF mobile as well as silencing the XYL complaints.

I think GG2IAQ uses a 4.7uF cap for one, and 10uF cap for the other. I've used 10uF for both which seems good, and a lot better than what Yaesu had.

There's another audio mod he also recommends which I think was part of the speak processor circuits, but Yaesu must have read his notes and have reworked that section.

Be careful though, it is rather tight getting to the area to solder these in, with lots of fine smt bits around, several people have caused more harm than good.

From: Dave AA6YQ
Topic: 27326 Message: 27374

Evidently, you failed to recognize that the message to which you responded below was private rather than public - so I'll provide the context for your response:

The fact that you found a reference on "some web site:" that "some eeprom" was capable of a million writes provides zero assurance to you on any other FT-817/857/897 owner who runs software that uses undocumented instructions that write to the transceiver's eeprom. Web sites are full of random assertions, some of which are true, and some of which are ludicrously false. Since we don't have access to the software that runs on the processor embedded within these transceivers, we don't know that this software doesn't itself write to various eeprom locations. Since the CAT instruction to write an eeprom location is undocumented, Yaesu engineers might have assumed that they had all of the eeprom's lifetime write budget at their disposal.

There are no grounds for believing that your eeprom with will "pop any day now". More importantly, there are no grounds for believing that it won't.

You might want to try the utility (modify.zip) that is in the files section of this group. It allows you to save all the unique service menu settings for your 857/897 to a small file on your PC. Should the unique settings in your radio become corrupt somehow, you can easily restore the original factory settings by uploading the service menu configuration that you saved in the file. It works like a charm.

re
"On a website I saw that each
memory location in an eeprom can be written to about a million

times."

On
another web site, I saw that the sun revolves around the
earth.

There
are many different kinds of eeproms, with different upper limits on writes. You need to know what part # Yeasu uses for its eeprom, and check the spec for that part. Also, you don't know how the embedded software in Yaesu's transceivers actually works. Their programmers might have assumed that no one else would be generating writes to eeprom locations, and therefore allowed their software to perform relatively frequent eeprom writes in order to simplify some other aspect of the code, or reduce resource requirements. As long as they stayed beneath the eeprom's write budget over the rig's expected lifetime, this would be fine. But if some software application start generating additional writes not contemplated by the original designers, one could wear out particular locations much more rapidly that if you had the entire write budget at your disposal.

I
don't know that the FT-897 software works this way -- but you don't know that it doesn't. My point is that you're making a lot of assumptions with nothing concrete to back them up. If you enjoy gambling, that's fine, but not everyone does.

You do not get idiotic people, just idiotic decisions. :)

On a website
I saw that each memory location in an eeprom can be written to about a million times. The chance of doing that in the lifetime is remote. it's more likely that the 897 will wear out before its eeprom does. I know somebody who bricked his 70cm by poking a 0 in the wrong place and it made 70cm deaf. That was fixed with a sig gen and a tap into the service menus and contrary to some beleif, doing a factory reset does not affect the service menu settings.

Subject: RE: [FT897] Soft ware

The
"idiot" appellation was Clint's,not mine.

The risk to users comes not
from incorrect programming in the CAT
application, but rather from a serial
port glitch (e.g. from RFI) that
transforms a correct EEPROM address into an
incorrect EEPROM address --
converting a write operation that updates the RF
power output level to one
that bricks the transceiver, for example. Its true
that any valid CAT
instruction could be corrupted into one that renders the
transceiver
unusable, but the odds of this happening are significantly
greater when CAT
commands that write to the EEPROM are frequently
used.

Sent: Wednesday,
19 August, 2009 3:35:20
Subject: RE: [FT897] Soft ware

Be aware that
those undocumented commands -- like setting RF output level --
require
writing to the FT-897's EEPROM. There are two problems with this:
EEPROM
locations can only be written a finite number of times before they
literally
wear out (I don't have the part # for the EEPROM used by Yaesu and
so don't
know what that limit is), and a data error can generate a write to
the wrong
EEPROM address, which can convert your FT-897 to a paperweight.
The discovery
of undocumented commands for the FT-817 was accomplished by
Clint KA7OEI;
see

<http://www.ka7oei. com/ft817_ meow.html>

These
commands are also available on the FT-857 and FT897. To quote
Clint,

"Command BC - Write EEPROM Data: ... Note that careless use of
this command
can cause the FT-817's CPU to crash and/or cause a complete wipe
of all
EEPROM data including configuration, software calibration/ alignment,
and
memories - the effect being similar to that of the "Reset to
Factory
Defaults" command (below!) If you insist on using this command
without
first recording the 76 "soft calibration" settings and noting what is
in
your radio's memories, you are an idiot! (Am I clear on this
point?)"

Commander, the transceiver control component of the freeware
DXLab Suite,
provides sliders that can be configured to control the FT-897's

power output
and other settings by generating CAT commands that write to
the
transceiver' s EEPROM -- but I recommend against doing
this.

Subject: Re: [FT897] Soft ware

To program your rig, rather than
just remote-control it, you need
something like this: http://www.g4hfq. co.uk/ftbasic. html

It's $15, but well worth it. I don't know of any
freeware apps for
programming the 897 (or any of Yaesu's other base/mobile
rigs, for
that matter.)

Also, none of the remote-control apps that
I've found can do things
like set the PL tone or repeater offset. They're
pretty useless for
anything but HF work. That's not the fault of the app
developers; the
problem is that the FT-897 just doesn't have CAT commands to
change
those settings. There's not even a documented CAT command
for
selecting a memory entry.

Ham Radio Deluxe comes the closest to
full control: it uses
undocumented CAT commands to write many of the
settings; it can
control power levels, but it still can't really be used for
repeater
work. You'll need to store repeater channels in memory with FTBasic
if
you're going to work them. (HRD works great for HF, though. I
love

being able to quickly set the power levels and run the radio from
the
larger control surface of my computer monitor.)

Nor does it make the site's content unreliable, although i've just completed the first year of a two year onc courese where one usint was based on mocrococontrollers. EEProms do have around a million write cycles per location, some have more some have less but you will not write to any location that many times in the radio's lifetime. Not unless you are constantly shifting the vfo but even then it there's no guarantee it writes to the eeprom then unless you power down. remember, EEPROM is non-volitiles and for general use it's morel ikes that the 897 will be using ram.
So seriously, enough arguing and don't worry about the eeprom. It won't pack up any time soon and very unlikely in the lifetime of the radio.

undocumented CAT commands to write many of the
settings; it can
control power levels, but it still can't really be used for
repeater
work. You'll need to store repeater channels in memory with FTBasic
if
you're going to work them. (HRD works great for HF, though. I
love
being able to quickly set the power levels and run the radio from
the
larger control surface of my computer monitor.)

From: DavidN
Topic: 27372 Message: 27378

Thanks Mark for all the info. Well looking at DG2IAQ's photos you have to remove the main board (willing to do that) but it's connected to another board via a flat cable, which does send shivers up my back. So I'll have to think hard about doing the mods.

I did do an on-air test using the speech processor, and with it in or out there seemed no difference except he said the audio was ever so slightly more bassy with it switched in. So possibly Yaesu never got round to modding mine! :)

I do have a Datong RF speech processor, but it's where to put it in the car.... I only just managed to shoe-horn the 897 into a gap above my right knee. The first attempt I couldn't reach the brake pedal :)

I've had the flat cable (and the board) out and back half a dozen times. It's really no big deal to get reattached. Obviously doing all the mods the first time is the best plan though.

My radio is a D variant so the speech processor mod was already present. In any case I improved the high response both on the op. amp train and also with a bypass capacitor on the emitter of the microphone amplifier (a bipolar NPN).

The AGC mod and optional audio PA bandwidth limiting components improved things to my mind.

The radio is very much a budget model with limited screening so any improvements are worthwhile I think. On the plus side it is attractively priced if you shop around.

A microcontroller could perform 1 million writes to an EEPROM location in less than 1 second. Obviously no one does that on purpose, but without access to the Yaesu code you have no idea whether this code writes to EEPROM locations and if so, to which locations it writes and how frequently. About all you can say is that you hope its okay.

I'm glad to hear that you are taking a course.

Nor does it make the site's content unreliable, although i've just completed the first year of a two year onc courese where one usint was based on mocrococontrollers. EEProms do have around a million write cycles per location, some have more some have less but you will not write to any location that many times in the radio's lifetime. Not unless you are constantly shifting the vfo but even then it there's no guarantee it writes to the eeprom then unless you power down. remember, EEPROM is non-volitiles and for general use it's morel ikes that the 897 will be using ram.
So seriously, enough arguing and don't worry about the eeprom. It won't pack up any time soon and very unlikely in the lifetime of the radio.

My
point is that a random reference on "some website" to an upper limit of "some
eeprom" is neither relevant nor reliable. There are no grounds to believe that
your eeprom will "pop any day now". More importantly, there are no rounds
to believe that it won't.

re
"On a website I saw that each

memory location in an eeprom can be written to about a million
times."

On
another web site, I saw that the sun revolves around the
earth.

There
are many different kinds of eeproms, with different upper limits on writes. You need to know what part # Yeasu uses for its eeprom, and check the spec for that part. Also, you don't know how the embedded software in Yaesu's transceivers actually works. Their programmers might have assumed that no one else would be generating writes to eeprom locations, and therefore allowed their software to perform relatively frequent eeprom writes in order to simplify some other aspect of the code, or reduce resource requirements. As long as they stayed beneath the eeprom's write budget over the rig's expected lifetime, this would be fine. But if some software application start generating additional writes not contemplated by the original designers, one could wear out particular locations much more rapidly that if you had the entire write budget at your disposal.

I
don't know that the FT-897 software works this way -- but you don't know that it doesn't. My point is that you're making a lot of assumptions with nothing concrete to back them up. If you enjoy gambling, that's fine, but not everyone does.

You do not get idiotic people, just idiotic decisions. :)

On a website
I saw that each memory location in an eeprom can be written to about a million times. The chance of doing that in the lifetime is remote. it's more likely that the 897 will wear out before its eeprom does. I know somebody who bricked his 70cm by poking a 0 in the wrong place and it made 70cm deaf. That was fixed with a sig gen and a tap into the service menus and contrary to some beleif, doing a factory reset does not affect the service menu settings.

Subject: RE: [FT897] Soft ware

The
"idiot" appellation was Clint's,not mine.

The risk to users comes not
from incorrect programming in the CAT
application, but rather from a serial
port glitch (e.g. from RFI) that
transforms a correct EEPROM address into an
incorrect EEPROM address --
converting a write operation that updates the RF
power output level to one
that bricks the transceiver, for example. Its true
that any valid CAT
instruction could be corrupted into one that renders the
transceiver
unusable, but the odds of this happening are significantly
greater when CAT
commands that write to the EEPROM are frequently
used.

Don't worry. I'm not an idiot. One
of the first tools I am writing is a
tool to backup the calibration settings
and memories.

One thing that you didn't mention about command BC is that
it writes two
bytes and not one so the best stratagy is to read two bytes
into memory
starting at the one you want to change, alter the one you want to
change
then write the memories back. that way you have little risk of writing
a

zero into something critical.
also back up what you
read.

Sent: Wednesday,
19 August, 2009 3:35:20
Subject: RE: [FT897] Soft ware

Be aware that
those undocumented commands -- like setting RF output level --
require
writing to the FT-897's EEPROM. There are two problems with this:
EEPROM
locations can only be written a finite number of times before they
literally
wear out (I don't have the part # for the EEPROM used by Yaesu and
so don't
know what that limit is), and a data error can generate a write to
the wrong
EEPROM address, which can convert your FT-897 to a paperweight.
The discovery
of undocumented commands for the FT-817 was accomplished by
Clint KA7OEI;
see

<http://www.ka7oei. com/ft817_ meow.html>

These
commands are also available on the FT-857 and FT897. To quote
Clint,

"Command BC - Write EEPROM Data: ... Note that careless use of
this command
can cause the FT-817's CPU to crash and/or cause a complete wipe
of all
EEPROM data including configuration, software calibration/ alignment,
and
memories - the effect being similar to that of the "Reset to
Factory
Defaults" command (below!) If you insist on using this command
without
first recording the 76 "soft calibration" settings and noting what is
in
your radio's memories, you are an idiot! (Am I clear on this
point?)"

Commander, the transceiver control component of the freeware
DXLab Suite,

provides sliders that can be configured to control the FT-897's
power output
and other settings by generating CAT commands that write to
the
transceiver' s EEPROM -- but I recommend against doing
this.

Subject: Re: [FT897] Soft ware

To program your rig, rather than
just remote-control it, you need
something like this: http://www.g4hfq. co.uk/ftbasic. html

It's $15, but well worth it. I don't know of any
freeware apps for
programming the 897 (or any of Yaesu's other base/mobile
rigs, for
that matter.)

Also, none of the remote-control apps that
I've found can do things
like set the PL tone or repeater offset. They're
pretty useless for
anything but HF work. That's not the fault of the app
developers; the
problem is that the FT-897 just doesn't have CAT commands to
change
those settings. There's not even a documented CAT command
for
selecting a memory entry.

Ham Radio Deluxe comes the closest to
full control: it uses
undocumented CAT commands to write many of the
settings; it can
control power levels, but it still can't really be used for
repeater
work. You'll need to store repeater channels in memory with FTBasic
if
you're going to work them. (HRD works great for HF, though. I

love
being able to quickly set the power levels and run the radio from
the
larger control surface of my computer monitor.)

27383. [FT897] AGC (And DSP) mod to FT-897

Yahoo group: FT897 (2009)
Date: 2009-08-20 14:42:51 UTC
From: Joe
Topic: 27383 Message: 27383

DSP AF is great..no doubt about it.....

Don't know if they are still in business, but..a friend ordered and
installed one of these **IN** his 897D and loves it....

http://www.w4wb.com/BHI/DSP-897.htm

I was going to install one in my 897D but then I traded it for an 857D and I
don't think there is room to install one internally in it.

“A microcontroller could perform 1 million writes to an EEPROM location in less than 1 second.”

From an FT897 standpoint no it can’t or at least the EEPROM would ignore it. Access time to an EEPROM for writing is typically 5mS [max] (for the 24LC128T device in the FT897) in addition to that the I2C bus to which it is connected runs at 400kHz max, IE about 40,000 per second assuming a 10 bit protocol.

EEPROM is notoriously slow for writing purposes. Usually this doesn’t matter as it’s only written to occasionally. With the products that I get I’m involved in the sales guys moan that flash upgrading or remote programming of a unit takes up to 30 seconds whereas reading is almost instant.

Yaesu clearly do write to the EEPROM for memory storage purposes but I doubt if they write to it adhoc, only a very junior engineer would make that mistake and then only once.

If I was going to tinker with writing and reading to the 897 (I actually have done a little) I would take a copy of the current readings and save them safely. Then if push can to shove I could program up a new chip and replace it on the PCB.

Definite care and attention is required to avoid a tricky soldering job but it’s hardly rocket science. If I was going to develop with the FT897 I would solder in a DIP socket so I could easily change the chip and experiment.

Topic: 27326 Message: 27386

Thanks for the EEPROM part number, Cliff. Here's the spec:
http://ww1.microchip.com/downloads/en/DeviceDoc/21191R.pdf

The spec says the device is rated at "more than 1 million erase/write cycles". I interpret this to mean "more than 1 million erase/write operations to any byte", as opposed to "each byte can be independently updated more than 1 million times" -- an interpretation I would discuss with the one of the manufacturers application engineers before putting weight on it. If true, this makes the likelihood of exceeding the erase/write budget more likely, particularly if Yeasu's code is performing background writes at a some constant rate with the assumption that users aren't increasing the rate by executing the undocumented instruction.

You're right, it would take a microcontroller ~85 minutes to perform 1 million erase/write cycles on this EEPROM. A program running on a PC is limited by the serial port, and so might be ~10X slower. No one would do this intentionally, but its not like decades are required to cause the problem .

Your point about being prepared to restore/replace the EEPROM echoes Clint KA7OEI's warning. Unfortunately, users exploiting the undocumented EEPROM write instruction are generally not aware of the risk.

From: kc9ipv
Topic: 27274 Message: 27387

Well, I got an email from the tech support guy from Yaesu. He is mailing the schematics today! Very supprised and impressed with the response from them.

I've managed to pic apart some of the circuit but the schematics will be very helpful.

Taking a stab at the cause I'd guess its in the voltage step up circuit since there is no AC input and the DC input is clean.

Anyone have a schematic for the W4RT unit?

mike
kc9ipv

>

From: Cliff Bryant
Topic: 27326 Message: 27388

Hi Dave

I've used the chip family dozens of times in the past – it's a useful stalwart.

I wouldn't want to write to the device anywhere near close to 1 million times. However I'd be pretty certain that Yaesu also don't adhoc write to it during normal operations. There are a number of reasons for this, firstly it's pretty slow as we've surmised, secondly there's no need. During normal rig operation the only obvious use would be memory or set up or possibly power off frequency storage and when they are done they are done.

You are quite right that without source code it's difficult to be sure but if one really wanted to know it would be easy enough to simply sniff the I2C bus and check.

Exploiting any undocumented command is always risky of course and you are most definitely right that if folk aren't aware of the limitation of write cycles to the device it's easy to write a piece of code that inadvertently (or otherwise) trashes the device.

However with a little care it shouldn't be too difficult to sort. The worry for me would be writing to the device such that the rig wouldn't boot correctly and allow me to replace the errant data!

I appear not to have either received or read Clint's warning but good to know there is some consensus.

I think you could perhaps perform 1 million cycles a little quicker than 85 minutes by using page mode to write data in blocks but it's a moot point.

Cliff

Subject: RE: [FT897] Soft ware

Thanks for the EEPROM part number, Cliff. Here's the spec:
http://ww1.microchip.com/downloads/en/DeviceDoc/21191R.pdf

The spec says the device is rated at "more than 1 million erase/write cycles". I interpret this to mean "more than 1 million erase/write operations to any byte", as opposed to "each byte can be independently updated more than 1 million times" -- an interpretation I would discuss with the one of the manufacturers application engineers before putting weight on it. If true, this makes the likelihood of exceeding the erase/write budget more likely, particularly if Yeasu's code is performing background writes at a some constant rate with the assumption that users aren't increasing the rate by executing the undocumented instruction.

You're right, it would take a microcontroller ~85 minutes to perform 1 million erase/write cycles on this EEPROM. A program running on a PC is limited by the serial port, and so

might be ~10X slower. No one would do this intentionally, but its not like decades are required to cause the problem .

Your point about being prepared to restore/replace the EEPROM echoes Clint KA7OEI's warning. Unfortunately, users exploiting the undocumented EEPROM write instruction are generally not aware of the risk.

73,

Dave, AA6YQ

Subject: RE: [FT897] Soft ware

“A microcontroller could perform 1 million writes to an EEPROM location in less than 1 second.”

From an FT897 standpoint no it can’t or at least the EEPROM would ignore it. Access time to an EEPROM for writing is typically 5mS [max] (for the 24LC128T device in the FT897) in addition to that the I2C bus to which it is connected runs at 400kHz max, IE about 40,000 per second assuming a 10 bit protocol.

EEPROM is notoriously slow for writing purposes. Usually this doesn’t matter as it’s only written to occasionally. With the products that I get I’m involved in the sales guys moan that flash upgrading or remote programming of a unit takes up to 30 seconds whereas reading is almost instant.

Yaesu clearly do write to the EEPROM for memory storage purposes but I doubt if they write to it adhoc, only a very junior engineer would make that mistake and then only once.

If I was going to tinker with writing and reading to the 897 (I actually have done a little) I would take a copy of the current readings and save them safely. Then if push can to shove I could program up a new chip and replace it on the PCB.

Definite care and attention is required to avoid a tricky soldering job but it’s hardly rocket science. If I was going to develop with the FT897 I would solder in a DIP socket so I could easily change the chip and experiment.

Subject: RE: [FT897] Soft ware

A microcontroller could perform 1 million writes to an EEPROM location in less than 1 second. Obviously no one does that on purpose, but without access to the Yaesu code you have no idea whether this code writes to EEPROM locations and if so, to which locations it writes and how frequently. About all you can say is that you hope its okay.

I'm glad to hear that you are taking a course.

I can't answer for Yaesu, but a common practice is to work in RAM and update the EEPROM only when you need to save. The radio is meant to be taken through an ordered power down which gives this opportunity. I've seen other devices do this, a pain if power is removed or the device crashes as in the case of some MP3 players I've had.

EEPROM writes are expensive both in terms of the limited rewrite cycles and the time it takes to perform the operation.

One way to test could be to remove power from the radio and see if the state is preserved, but that is not recommended. It has happened here once accidentally and I didn't check to see what happened.

If the designers expected power failure to be a problem that had to be defended against then there are ways of solving it. I'm only guessing here but I'd expect something like this radio to be designed for ordered power down either due to the user pressing the blue button or battery voltage dropping below some threshold. I've seen the latter out in the field and was happy that the radio appeared to shut down in an ordered way.

Do we often hear of the EEPROMs failing on these things?

Yes, I saw the page mode access in the spec, but thought that'd be "cheating" with respect to the discussion at hand. And I don't think one can initiate a page-mode write over the serial port interface.

Clint KA7OEI's web page is available via <http://www.ka7oei.com/ft817_meow.html>

If you look at <http://www.ka7oei.com/ft817_meow.html> you'll see what Clint KA7OEI determined to be stored in EEPROM.

No one is saying that there's an EEPROM failure problem with a FT-817/857/897. At question is whether running software that uses the undocumented "write to EEPROM" command to gain capabilities not provided through the documented CAT instruction set (e.g. changing the rig's RF output level) could result in exceeding the EEPROM's lifetime write/erase cycle budget, which is "more than 1 million write/erase cycles". Until someone determines how frequently the software embedded in the transceiver performs EEPROM writes and thus what portion of the lifeltime write/erase budget it consumes, its all speculation.

The "mine works just fine" argument holds little water; someone making this claim might be the lucky owner of an FT-897 whose charmed EEPROM will tolerate 10 million write/erase cycles before expiring; this is little solace to the owner of another FT-897 whose EEPROM can only handle 1.2 million.

27393. EEPROM write dangers?

Yahoo group: FT897 (2009)
Date: 2009-08-20 03:19:29 UTC
From: kc9aop
Topic: 27393 Message: 27393

I'm new to the FT-897 and this group but have been a HAM for 8 years. I've been reading threads that extol the dangers of writing to the EEPROM on the radio. Can someone please list the "dangerous" commands so I can avoid inadvertently damaging my new radio??

I've already shut off the sliders on HRD (I like the program) and am wondering if there are any other commands to avoid.

Besides the ADMS software, which is great for my HT but I'm not so sure about the 897, what would the group recommend for programming and/or control software. I know HRD won't program memories but I'm not sure if the ADMS will do more than manage the memory.

Your help and comments are appreciated

EEPROMS and flash memory are not individually addressable for
re-writing. You have to erase an entire block of memory and then
re-write the entire block. That's why it's so easy to brick a flash
drive or memory card: if a write fails, it doesn't just affect a
single cluster.

You can disconnect power from the 897 at any time, and it'll power
back up in the same state you left it... I wonder if every button
press on the radio's front panel results in an EEPROM write, or if the
radio has something to dump the state to the EEPROM very quickly when
power is disconnected. I sure wish a Vertex engineer was part of the
group. :)

DSP AF is great..no doubt about it.....

Don't know if they are still in business, but..a friend ordered and
installed one of these **IN** his 897D and loves it....

http://www.w4wb. com/BHI/DSP- 897.htm

I was going to install one in my 897D but then I traded it for an 857D and I
don't think there is room to install one internally in it.

EEPROMS are byte writable (or this EEPROM is at least), FLASH is not. The datasheet describes the byte and page write commands. When writing a page you are limited to a page boundary ie an exact memory page size.

As for state backup: it may simply be held in RAM with a capacitor to back it up.

There are a number of documents on the web describing the usage of the EEPROM in the 897. They have been determined empirically rather than from formal documentation.

Cliff, G4PZK

To: FT897@yahoogroups.com
Subject: Re: [FT897] Soft ware

EEPROMS and flash memory are not individually addressable for re-writing. You have to erase an entire block of memory and then re-write the entire block. That's why it's so easy to brick a flash drive or memory card: if a write fails, it doesn't just affect a single cluster.

You can disconnect power from the 897 at any time, and it'll power back up in the same state you left it... I wonder if every button press on the radio's front panel results in an EEPROM write, or if the radio has something to dump the state to the EEPROM very quickly when power is disconnected. I sure wish a Vertex engineer was part of the group. :)

I think they're intended for different uses.

An IF DSP can help with things like adjacent signal rejection, which will help with crowded bands (PSK31 on Field day, for example, was a nightmare with my radio.) No audio DSP can help there, since the AGC has already attenuated out all the weaker signals by the time the audio reaches the AF stage.

On the other hand, AF filtering is simpler and probably cheaper in terms of hardware...

I use FTBasicMMO by G4HFQ for memory management. Not only does it save
and load memories, but it can also import and export to several other
memory control programs. In fact, the first time I used it, I used it
to read the memory settings from my Kenwood handheld. (It won't read
the Kenwood directly, but it will read the Kenwood MCP file.)

But the IF DSP will take out the noise before it pumps the AGC (and shows up on the S meter) causing desense on receive. Most new radios today are IF DSP-the Yaesu FT450/950/2000/9000 and the Icom 7200/7000/746PRO/7600/7800 etc.

Which new radio that has come out in the past 2 years has AF DSP on it?

Well, I got an email from the tech support guy from Yaesu. He is mailing the schematics today! Very supprised and impressed with the response from them.

I've managed to pic apart some of the circuit but the schematics will be very helpful.

Taking a stab at the cause I'd guess its in the voltage step up circuit since there is no AC input and the DC input is clean.

Anyone have a schematic for the W4RT unit?

mike

It would be really nice to sus out and eliminate the source of noise from the cd-24. I thought for sure the noise was coming from the Pa-26 wall charger. I want to use a solar panel for portable operation but if there is going to be noise injected using a panel, then its back to lugging extra batteries.
B.T.W. how did you manage to open the cd-24 case? I tried to open mine but it seemed that the cover would break instead of popping off.

Yes, there is room. I have the BHI 1061 DSP board in my FT-897. There is a "how to" here in the files. Look at KB5LDD's folder, "BHI DSP module on FT-897D".

I had a great deal of trouble trying to put the control button in the place they showed. Instead, I removed the Battery A/B rocker switch and glued in a piece of textured ABS plastic sheet. I mounted the DSP button and LED there.

I don't use the internal battery feature, instead, when using batteries (such as Field Day) I have some RBC-6 gel battery sets (1 RBC-6 is comprised of two 12 v 12 ah sealed batteries) that I use for that purpose.

The BHI 1061 is a MUCH better DSP than the 897's DSP. If you want to hear how effective, listen to the MP3's in my AE5JU folder, BHI DSP subfolder. Photos of the RBC-6 are in that same folder. Also a photo of how I installed the DSP's control button. I used a craft glue called E6000 by Eclectic Products. Great for plastic to metal, etc. A must have item for the bench for anyone working in electronics.

An easier way... simply purchase the West Mountain Radio CLR-DSP speaker. This speaker has a 2 w audio amp and DSP built into the speaker. The FT-897 greatly benefits from a better speaker anyway. And to my ear, the CLR-SPKR's DSP sounds identical to the BHI 1061 module. I would be willing to bet they share the same chip set.

Hi Jim,

I use the RT Systems ADMS software for memory programming with my 897D (5 years old) and have enjoyed the convenience since it was new. The ADMS software also allows you to store your setup information for such things as the LCD display settings and programmable buttons on the MH-59 remote mic. You will find that users of the FTBasic program written by G4HFQ are very happy with that package as well.

I also began using Ham Radio Deluxe as soon as the 857/897 series was supported for rig control, with all the sliders you can imagine enabled, with no worries. I believe Yaesu put the CAT port on the back panel exactly for that purpose. I have heard nothing that indicates a flood of failures (or even one failure) for the 857/897 series from using any parts of Ham Radio Deluxe to control its functions.

re " I believe Yaesu put the CAT port on the back panel exactly for that purpose."

If that were true, Yaesu would have documented the CAT instructions that read and write the EEPROM, documented the layout of the information in the EEPROM, and provided an explicit budget for write/erase cycles (subtracting from the EEPROM's limit the writes generated by their embedded software).

Each radio's EEPROM has a lifetime limit on write/erase cycles. The fact that no failure has been reported to date tells you nothing about consumption of that budget by any particular radio other than that you haven't exceeded its limit yet. You might never come within a factor of 10 of exceeding it, or you might exceed it a few seconds after receiving this message.

David,

How many 897/857's have failed from EEPROM failure? I have read the entire thread and fully understand the concepts discussed, but the reality is that in the field, the rigs are not failing from the utilization of rig control software. I would suggest you bring your concerns regarding this topic to Yaesu. Ask them how many EEPROM failures have turned up in their service centers. Until you have facts to present regarding actual failure rates, everything else stated in this thread is unsubstantiated speculation.

Rob, as I have pointed out (repeatedly), the absence of failures to this point in time only means that the limit has not yet been reached. It tells you nothing about when the limit will be reached.

Given this uncertainty, I advise users of FT817s, FT857s, and FT897s to not use the undocumented "write to EEPROM" CAT command; those that do so anyway at least understand the risk they are taking, the magnitude of which lies somewhere between negligible and signficant.

I'll leave the thrill of contacting Yaesu to those who advocate the use of the undocumented "write to EEPROM" CAT command. I'd be happy to learn that there's no risk, but until then I'll control my FT-817's RF power level by hand.

73,

Dave, AA6YQ

Subject: [FT897] Re: EEPROM write dangers?

David,

How many 897/857's have failed from EEPROM failure? I have read the entire thread and fully understand the concepts discussed, but the reality is that in the field, the rigs are not failing from the utilization of rig control software. I would suggest you bring your concerns regarding this topic to Yaesu. Ask them how many EEPROM failures have turned up in their service centers. Until you have facts to present regarding actual failure rates, everything else stated in this thread is unsubstantiated speculation.

73,

Rob W1AEX

Fair enough David.

In the interest of clarity, pages 61 and 62 of the 897D manual do give explicit information regarding the command structure used in the FT-897's CAT system. In the manual, owners are invited to explore the use of third party control software as Vertex has chosen not to enter that arena. In fact, multiple examples of how to format control commands are offered for those who wish to write their own software. I suppose using the software would be every bit as safe as using the MH59A8J remote functions on the microphone to adjust my volume levels or frequency on the fly.

On the day my 897D fails with no hope of repair, I will smile, pat its top cover, and thank it for its good service. Then again, my Johnson Viking One is still running fine every day, and it was built in 1950.

Regards,

Rob W1AEX

You will not find a description of either the "Read EEPROM" or "Write EEPROM" commands on pages 61 or 62 or anywhere else in your 897D manual, or in the equivalent manual for an FT-817 or FT-857. The existence and function of these commands was reverse engineered by Clint KA7OEI.

At present, your supposition about the safety of using software that uses the "Write EEPROM" command is supported only by hope. Your Viking One, however, is perfectly safe.

73,

Dave, AA6YQ

Would someone help me understand what these options do?

[From the manual]
MENU MODE No□067 [PG C]
Function: Programming the [C] key (in the Operating Function
Row 17) function.
Available Values: All Multi Function , all Menu Item,
MONI, Q.SPL, TCALL, ATC and USER. <===
Default: ATC

It doesn't seem to be covered in the manual anywhere. I expect they
think I know, but I don't.

From: DavidN
Topic: 27372 Message: 27416

[Quote] I've had the flat cable (and the board) out and back half a dozen times.
It's really no big deal to get reattached. Obviously doing all the mods the first time is the best plan though.

My radio is a D variant so the speech processor mod was already present. In any case I improved the high response both on the op. amp train and also with a bypass capacitor on the emitter of the microphone amplifier (a bipolar NPN).

The AGC mod and optional audio PA bandwidth limiting components improved things to my mind.

The radio is very much a budget model with limited screening so any improvements are worthwhile I think. On the plus side it is attractively priced if you shop around.

Cliff, G4PZK [end quote]

Yes, I got quite good deal from Nevada after seeing them selling the 897 at discount on Ebay.co.uk ;)

You've laid my mind a bit a rest as now looking closely at the flat cable in the photo it does actually look like a proper cable rather than the flat plastic type that can easily break, but as you say, do all mods at once :)
I'm also thinking of adding the DSP module as discussed in another thread.....

Be interested to hear about the 'optional audio PA bandwidth limiting components improved things to my mind' as I can't seem to find that mod and *some* stations on FM sound quite muddy, compared to the FT-2800 I had before.... Also, the value you used for the bypass cap.on the emitter of the mic.amp..

You don't know either... (-:

I have two versions of the 897 manual and neither one says what these functions do. Or why I might want to employ them.

Perhaps you can post a link to the version of the manual you are referring to.

I have:
file size Name
3,298,389 FT-897D_Operating Manual.pdf
3,134,556 FT-897_OpMan.pdf

As you can see these are very nearly the same size and I can tell you they don't differ much in content.

But I would welcome another source.

KC8UGV, perhaps you're not being specific enough as to your need. Do you mean the option MENU MODE 067, or the options that can be programmed into Panel Key C? e.g. ATC, Q.SPL, MONI (covered on page 17).

But my question is... what is TCALL and USER?

The bottom of page 17 of the FT-897D talks about Q.SPLIT, ATC and MONI. The other settings, USER and TCALL, appear to be MH-59A8J features.

My question too. In my post with the RICH-TEXT option, I had made the four choices bold. That didn't show up on my message.

Quite right, the four function that can be programmed into menu screen 'Q'
Namely:
1. MONI - Monitor? This button does it's duty only while you hold it.
2. Q.SPL - Quickly adds SPL to the upper left corner of the display.
3. TCALL - Sends a signal. Tuner calibrate?
4. USER - This adds [] brackets around the menu item. Showing it's selected.

Alright. I should have done this step BEFORE I worthe my first message. But if anyone cares to expand on my definitions PLEASE feel free.

27422. W4RT Electronics bhi DSP Module (NEDSP-1061 KBD)

Yahoo group: FT897 (2009)
Date: 2009-08-21 16:16:54 UTC
From: K9ZTV
Topic: 27415 Message: 27422

Anyone contemplating the purchase of W4RT Electronics' NEDSP-1061 DSP module should be advised of the following:

1) It is an excellent module and W4RT is an excellent vendor.

2) In-board installation, whether done by yourself or by W4RT, results in a slight but noticeable distortion in the audio of SSB/AM/FM signals on SOME transceivers. It is believed that early production FT-897s and FT-817s carried a component that was different in value from the one indicated in the schematics. It is believed that this issue appeared either on this reflector or on the FT-817 reflector early on in the life of both reflectors, but those I have talked to about this problem cannot recall which reflector, or which component, or during what lot number(s).

3) The distortion is most noticeable when listening to local broadcast stations on the FM band (88-108 Mcs.) It will appear as a "clipping" every 10 seconds or so. Since purchasing the FT-897 in 2002 (SN 2J-020481) I have often enjoyed listening to classical music at my office while doing bookwork (the curse of small business) and have always marveled at how good it sounded through an external speaker. Earlier this summer I had W4RT install the DSP module and the distortion/clipping immediately was apparent upon its return. They installed a replacement module but the distortion remained.

4) If anyone knows anything about the incorrectly installed component (resistor, capacitor -- no one seems to remember), please contact me.

5) My own immediate solution was to purchase a new FT-897D which I had been contemplating anyway since Yaesu has improved the rig over the intervening seven years with a better roofing filter and other circuit changes. But I would very much like to correct the problem in the 2002 rig.

6) I would assume the outboard bhi DSP module (1062) is unaffected since no modifications are made to the transceiver itself.

OK this helps a bit.

[From the manual]

[A] Key: MONI
Press the [A](MONI) key to disable the Noise Squelch.
You may program the configuration of this key by the Menu Mode No-065 [PG A].

A fast way to hear those weak signals?

[B] Key: QSPL
Press the [B](QSPL) key to change the Sub VFO frequency (Main VFO frequency + 5 kHz) and automatically engage
the "Split" feature.
You may program the configuration of this key by the Menu Mode No-066 [PG B].

Quick Split. That one I can see straight away. To work a pile-up this is often the way one station can sort thru all of the calling stations as fast as possible.

[C] Key: ATC
Press the [C](ATC) key to activate a 1750-Hz burst tone for 2 seconds when pressing the PTT switch while the channel
is clear.
You may program the configuration of this key by the Menu Mode No-067

What does ATC stand for? And why/when would this be useful?
[PG C].

And TCall and USER ?

This is helping!
Thanks!

If I get time I could test what I suspect TCALL is. On some older Yaesu radios it is "Tone Call" and will cause the radio to transmit a tone while it is pressed in order to open older repeaters that don't use CTCSS. The test will be to use two radios and listen on the second while pressing this button in the 897. Even if you have only one radio, see if the transmit light comes on when you press this button.

From: K9ZTV
Topic: 27425 Message: 27425

Mr. Finnigann . . .

I can send you a PDF of the paragraph I cited if you wish.

Menu row "q" allows for user-programming of the three buttons (A,B,C)
located under the display for use when you are IN menu row "q".

For example, on my rig I have the A-button programmed to put the
(optional) 300 filter inline; the B-button programmed to put the 2.3
filter inline; and the C-button programmed to activate the [KYR] function.

It's merely to make the rig for flexible for individual users.

How can I help further? Offline would be best.

73,

Kent K9ZTV

I found out the difference in the two manuals I have, one doesn't cover the optional microphone. Which is where another clue to my question lays.

The 1750mhz tone is used for repeater access. Mostly in Europe.

OKay, this is good.

USER, last one:

"USER" DEFINED DIGITAL MODES [pg 39 Operating Manual]
Also provided in the FT-897D are two convenient "USER"
Digital modes, one each providing USB- and LSB-side injection,
which may be used for SSTV, Fax, Pactor, and other
digital operating modes.

I'm not up on my digital mode usage. But three out of four ain't bad.

Good news. I located the info with alot of help on various pages. of the two mauals I already had.

The manuals are not designed to be teaching manuals and suffer when I tried to use them that way.

>

>

I experimented with the menu 'Q' too I had the power level adjustment on one. But I didn't understand then what the default options ment/did. I have a much better understanding now.

Recapping:
1. Press the [A](MONI) key to disable the Noise Squelch.

2. Press the (QSPL) key to change the Sub VFO frequency (Main VFO frequency + 5 kHz) and automatically engage
the "Split" feature.

3. Press the (TCALL) - Sends a signal. Tuner calibrate?

4. Press the (ATC) key to activate a 1750-Hz burst tone for 2 seconds when pressing the PTT switch while the channel
is clear.

5. Press the (USER) - DEFINED DIGITAL MODES
Also provided in the FT-897D are two convenient "USER" Digital modes, one each providing USB- and LSB-side injection,
which may be used for SSTV, Fax, Pactor, and other digital operating modes.

27431. RE: [FT897] AGC mod to FT-897 - anyone done it?

Hi David

If I recall correctly the capacitor was 220n, I actually used 2x100n in parallel as that was all I had. You can calculate the turnover frequency for the amplifier easily enough and set it to what you want.

The mod to the audio PA is to provide HF rolloff for the output audio amplifier. It just reduces the hiss (that's hiss from the amplifier rather than the radio although it will do both of course). Just search for the data sheet on the output TDA device (can't remember the part number off hand). The data sheet specifies the changes, basically just an R and C in series.

I got my rig second hand (it was actually new and boxed, unopened) from another G4. It was bought specifically to take on holiday and operate from a solar panel plus battery. It works pretty well in fact after the audio had been lifted a little.

It's never going to sound 'hifi' (not that I want it to) but a little hf boost helps when running relative QRP.

Cliff

Subject: Re: [FT897] AGC mod to FT-897 - anyone done it?

[Quote] I've had the flat cable (and the board) out and back half a dozen
times.
It's really no big deal to get reattached. Obviously doing all the mods the first time is the best plan though.

My radio is a D variant so the speech processor mod was already present. In any case I improved the high response both on the op. amp train and also with a bypass capacitor on the emitter of the microphone amplifier (a bipolar NPN).

The AGC mod and optional audio PA bandwidth limiting components improved things to my mind.

The radio is very much a budget model with limited screening so any improvements are worthwhile I think. On the plus side it is attractively priced if you shop around.

Cliff, G4PZK [end quote]

Yes, I got quite good deal from Nevada after seeing them selling the 897 at
discount on Ebay.co.uk ;)

You've laid my mind a bit a rest as now looking closely at the flat cable in
the photo it does actually look like a proper cable rather than the flat plastic type that can easily break, but as you say, do all mods at once :)
I'm also thinking of adding the DSP module as discussed in another thread.....

Be interested to hear about the 'optional audio PA bandwidth limiting components improved things to my mind' as I can't seem to find that mod and
some stations on FM sound quite muddy, compared to the FT-2800 I had before.... Also, the value you used for the bypass cap.on the emitter of the
mic.amp..

David G4TUP.

Commander lets you

- define up to 16 button-initiated command sequences, with each sequence containing up to 32 commands. For the Yaesu FT-817/857/897 transceivers, commands are expressed in hexadecimal. Commands within a sequence can also alter the flow of control, change the caption on their initiating button, and illuminate an LED-like display in a specified color.

- define up to 8 "sliders", each of which when moved substitutes the current value of the slider into a command template and sends the resulting CAT command to your transceiver

- view and record the CAT commands its sends to your transceiver and the responses received from your transceiver

Commander is free, and available via www.dxlabsuite.com . The use of its command sequences and sliders is documented in http://www.dxlabsuite.com/commander/Help/CommandSequences.htm .

Joe,

The TS480 does not contain IF DSP, only AF DSP. A good example of AF vs IF comes with a notch filter. A IF notch filter will remove the carrier before it gets into the AGC loop. You will see the S meter reading drop when you engage the filter, and the later stages of the receiver are no longer hearing the carrier and reacting to it, like AGC pumping. A AF notch will prevent you from hearing the carrier (maybe) but the receiver is still hearing it. Check the S meter-the reading for the carrier doesn't change. The AGC circuit will be reacting to the carrier and maybe desensing the receiver.

A good example of this was on the TS570D. I used one for a little while before installing the CW filter. I could use the AF bandpass DSP filter to narrow down the receive on CW, but all of a sudden, a signal I was listening to disappeared! I opened up the DSP bandpass filter and there was a strong CW station 1KHZ up or so. I wasn't hearing it thanks to the DSP but the receiver was and was reacting to it. The AGC reduced the front end gain due to this other signal, so I lost the signal I was copying.

----- Original Message -----
From: "John Geiger" <aa5jg@yahoo. com>
Subject: Re: [FT897] AGC (And DSP) mod to FT-897

But the IF DSP will take out the noise before it pumps the AGC (and shows
up on the S meter) causing desense on receive. Most new radios today are IF
DSP-the Yaesu FT450/950/2000/ 9000 and the Icom 7200/7000/746PRO/ 7600/7800
etc.

Which new radio that has come out in the past 2 years has AF DSP on it?

Okay, you know when you press F and turn the dial, the menu items at the bottom of the screen change?

There are several pages, a-q. The last one, and the 3 buttons on that page are configurable.

Menu 67 changes the action that the C key has when it's on that last page. That should mean that 65 and 66 edit the A and B buttons.

As an added bonus, if you buy the DTMF microphone, you can program the ACC key and the P1 and P2 keys for any purpose as well. I have my ACC key programmed for the power level menu entry, and the P1 and P2 toggle the IPO and ATT functions.

Heh. I misunderstood the first time around. I thought you were trying to find out what Menu 67 does, but you're asking about the specific items there.

MONI: lets you disable squelch to listen to a channel. (Useful when using tone squelch)
Q.SPL: Quick split. Transmit 5KHz higher than the current frequency.
TCALL: not mentioned in the manual.
ATC: sets the 1750 Hz tone burst for opening European repeaters.
USER: The only reference I can find to this is the USER-L/U digital modes. Don't know if this activates digital mode or what...

BTW, it's not a 1750 MHz tone. It's a 1750 Hz tone. That's a nice, high pitched BEEP, probably about the same frequency as the annoying little buzzers in multi-meters and watch alarms.

I have a digital interface box plugged in to the 897 at home. I'll try the USER toggle tonight; if that's a quicker way to select digital mode, that might be useful.

You this is quite funny.

Seems people are happy to play around in the memory setting without any worries as you suggest.

There are issues with lifetimes to EEproms if written to too many times, though it is rare Eeproms collapse from this. On old equipment 15 to 20 years we do however sometimes see memory ic's of various types failing over time rather than being over written where the logic output levels drop below the threshold. Usually if you lower the power supply voltage of an eprom reader, you can get the code out and reprogram them. Not sure about the serial write ones, haven't had one die due to age yet, but this happens with both Eproms and EEproms.

Back to the funny bit.

A day or so ago we had lots of legal arguments from wide banding an operation where we at least know the outcome. But randomly playing with the internal memory parameters where lots of the setup and calibration parameters exist without a clue what any of those memory areas do, is more likely to create an illegal radio, even within the ham bands, I am amazed none or a legal bods have piped up, not that I wish that either.

There are people who have developed external software to modify these, I do know one has a full lab and thoroughly tested the radio after various changes he made whilst learning the mapping structure. However people should avoid randomly changing things unless they have the skills and test equipment to prove the radio is suitable to continue to be used, I know most hams licenses require that, but I rarely see a ham that properly conducts any tests.

Rob, as I have pointed out (repeatedly), the absence of failures to this point in time only means that the limit has not yet been reached. It tells you nothing about when the limit will be reached.

Given this uncertainty, I advise users of FT817s, FT857s, and FT897s to not use the undocumented "write to EEPROM" CAT command; those that do so anyway at least understand the risk they are taking, the magnitude of which lies somewhere between negligible and signficant.

I'll leave the thrill of contacting Yaesu to those who advocate the use of the undocumented "write to EEPROM" CAT command. I'd be happy to learn that there's no risk, but until then I'll control my FT-817's RF power level by hand.

Subject: [FT897] Re: EEPROM write dangers?

David,

How many 897/857's have failed from EEPROM failure? I have read the entire thread and fully understand the concepts discussed, but the reality is that in the field, the rigs are not failing from the utilization of rig control software. I would suggest you bring your concerns regarding this topic to Yaesu. Ask them how many EEPROM failures have turned up in their service centers. Until you have facts to present regarding actual failure rates, everything else stated in this thread is unsubstantiated speculation.

From: Cliff Bryant
Topic: 27393 Message: 27445

Hi Mark

I can't agree that it's rare for EEPROMs to collapse if written to too many times.

It's rare that they collapse if used within specified write parameters (number of writes) but if you write to them beyond their specification they most definitely do fail (at some point). We get instances of this from time to time with our embedded systems when a junior (or senior!) engineer makes an error in his coding and writes (often during a timing routine) to a device. It's more annoying when the device in question is something like an Atmel processor where the EEPROM in question is on chip.

As I said before I do think that it's very unlikely that Yaesu will write to the device unless absolutely necessary (good programmers will 'ring fence' the write routine during development and add a counter to check for this) however if somebody simply writes a program to continuously update FT897D memories it will eventually fail.

As for the legal issues they very much depend on the jurisdiction involved of course. Band police are everywhere as well these days, not least because less and less folk have any idea about the technology involved.

Cliff, G4PZK

Sent: 21 August 2009 08:10
To: FT897@yahoogroups.com
Subject: RE: [FT897] Re: EEPROM write dangers?

You this is quite funny.

Seems people are happy to play around in the memory setting without any worries as you suggest.

There are issues with lifetimes to EEproms if written to too many times, though it is rare Eeproms collapse from this. On old equipment 15 to 20 years we do however sometimes see memory ic's of various types failing over
time rather than being over written where the logic output levels drop below
the threshold. Usually if you lower the power supply voltage of an eprom reader, you can get the code out and reprogram them. Not sure about the serial write ones, haven't had one die due to age yet, but this happens

with
both Eproms and EEproms.

Back to the funny bit.

A day or so ago we had lots of legal arguments from wide banding an operation where we at least know the outcome. But randomly playing with the
internal memory parameters where lots of the setup and calibration parameters exist without a clue what any of those memory areas do, is more
likely to create an illegal radio, even within the ham bands, I am amazed
none or a legal bods have piped up, not that I wish that either.

There are people who have developed external software to modify these, I do
know one has a full lab and thoroughly tested the radio after various changes he made whilst learning the mapping structure. However people should
avoid randomly changing things unless they have the skills and test equipment to prove the radio is suitable to continue to be used, I know most
hams licenses require that, but I rarely see a ham that properly conducts
any tests.

It'll be interesting to learn about this hither-to un-used function.

I just figured (after watching this group) that eveyone knew about everything about the 897D.

Me, on the other hand, am floundering in a (deep) sea of ignorance.
But I'm learning something everyday. For example... I lean\rned not long ago that an antenna (vertical in this case) can be setup on a trailer roof JUST like a magmount on a car. The trailer roof acts like the ground plane. -- I didn't know this. And since I *live* in such a trailer, on a lot hardly bigger than the trailer, a good ground system was but a dream for me.

I wrote a couple of antenna manufactures and asked them... Oh yeah they all knew of hams that had such a set up. NEWS to me. I've never read a single word about anything working near a trailer.

What a day that was!

But I digress... sorry.

EEproms memory also has a read limit too. It's higher than the write limit but the system writes to the eeprom when you set a memory or turn the machine off. Telling nt to write to something at all that allows a million or so write cycles before it starts to fail even if it does then is panic spreading. likely my 897 will not last as long as its eeprom

Subject: RE: [FT897] Re: EEPROM write dangers?

Rob, as I have pointed out (repeatedly) , the absence of failures to this point in time only means that the limit has not yet been reached. It tells you nothing about when the limit will be reached.

Given this uncertainty, I advise users of FT817s, FT857s, and FT897s to not use the undocumented "write to EEPROM" CAT command; those that do so anyway at least understand the risk they are taking, the magnitude of which lies somewhere between negligible and signficant.

I'll leave the thrill of contacting Yaesu to those who advocate the use of the undocumented "write to EEPROM" CAT command. I'd be happy to learn that there's no risk, but until then I'll control my FT-817's RF power level by hand.

David,

How many 897/857's have failed from EEPROM failure? I have read the entire thread and fully understand the concepts discussed, but the reality is that in the field, the rigs are not failing from the utilization of rig control software. I would suggest you bring your concerns regarding this topic to Yaesu. Ask them how many EEPROM failures have turned up in their service centers. Until you have facts to present regarding actual failure rates, everything else stated in this thread is unsubstantiated speculation.

1. I don't recall seeing a limit on read operations in the spec for the EEPROM used in the FT-897

2. If you peruse Clint KA7OEI's web page - specifically the memory layout - you'll see that there are many parameters stored in EEPROM

3. Unless you have access to Yaesu's source code or have monitored the EEPROM with a scope or logic analyzer, you have no idea at what frequency EEPROM write operations are performed by the code embedded in the FT897. Thus you do not know whether additional EEPROM writes generated by software using the undocumented CAT instruction are or are not problematic.

It is highly unlikely that, even if there are Yaesu employees lurking on this reflector, that they will admit as much. Doing so would immediately be taken by the masses as an assertion that their posts represent 'the gospel according to Yaesu' and their continued employment by Yaesu would be in serious jeopardy, even if they loudly proclaimed that their opinions were strictly their own and not Yaesu's.

27452. Memory quirk?

Yahoo group: FT897 (2009)
Date: 2009-08-22 16:12:59 UTC
From: DavidN
Topic: 27452 Message: 27452

Hi Guys! Dont' know if this quirk has been mentioned before in this forum - I did start reading all the forum messages from number one, but when I reached message number 650 of the 22,000 my brain started to steam..... Anyway.... this is the quirk I have found.

I have my Memory Group set to ON so this means I have ten banks of 20 memories and have put different band's calling channels, repeaters, beacons etc in each bank. Now, if I have selected memory *Mg16* (this is for example but it could be any memory really) and listen, have a QSO, what-have-you.... there, then press the MEM/VFO knob and move to bank *Md* and go to say memory *Md09* (again just an example, it could be any memory in the whole ten banks), and have a QSO, what-have-you...., then press the tit (the MEM/VFO button) and move back to bank *Mg* (wanting to go back to *Mg16*), when I get to bank *Mg* it puts me straight on to *Mg00* not *Mg16* i.e. it hasn't remembered I was in memory 16 when I moved away from that bank.

If I go straight back to bank *Md*, again it takes me to memory 00, not 09. In fact, any memory bank I go to it goes to *00* memory. I presume everyone else finds it to be this way?

Now, I only mention this in case Yaesu do read this forum and decide to take on board the quirk... or... need for just a little more sophistication in moving around memories :)

(Mind you, I would be surprised if Yaesu did read all their rig's forums - it would be like painting the Forth Bridge :)).

Enjoy!

David G4TUP.

DRAMs do not have limits on read or write operations. Some EEPROMs do not have limits on read operations.

A serial port sniffer will not allow you to determine how frequently the software running on your transceiver's microprocessor emits EEPROM write operations. You either need the source code for this software, or you need a way of monitoring the EEPROM - e.g. with a scope or a logic analyzer. If you perform this assessment, please share your results here.

Then you think the 897 should write this info every turn of the knob? I
assume this state to be recalled if a power outage interupts your radio
session.

Or only when the knob to change bands is invoked.

Kenwood customer service monitors the Kenwood reflector at qth.net and will get on and respond to customer's questions at time-usually trying to push a Kenwood product, though, which is understandable.

Supposedly Elecraft monitors the Elecraft reflector as well.

I don't know about Vertex USA, but at Motorola, we're not supposed to talk about company business in on-line forums and mailing lists. The argument is there are official channels for support & PR communication.

Well, I learned that the USER toggle doesn't seem to have anything to
do with the user-selectable digital mode. The audio on tx or rx
doesn't change. I'll keep digging and see what I can find out.

Has anybody else experimented with the function to see what it does?

Subject: RE: [FT897] Re: EEPROM write dangers?

You will not find a description of either the "Read EEPROM" or "Write EEPROM" commands on pages 61 or 62 or anywhere else in your 897D manual, or in the equivalent manual for an FT-817 or FT-857. The existence and function of these commands was reverse engineered by Clint KA7OEI.

At present, your supposition about the safety of using software that uses the "Write EEPROM" command is supported only by hope. Your Viking One, however, is perfectly safe.

Subject: [FT897] Re: EEPROM write dangers?

Fair enough David.

In the interest of clarity, pages 61 and 62 of the 897D manual do give explicit information regarding the command structure used in the FT-897's CAT system. In the manual, owners are invited to explore the use of third party control software as Vertex has chosen not to enter that arena. In fact, multiple examples of how to format control commands are offered for those who wish to write their own software. I suppose using the software

would be every bit as safe as using the MH59A8J remote functions on the microphone to adjust my volume levels or frequency on the fly.

On the day my 897D fails with no hope of repair, I will smile, pat its top cover, and thank it for its good service. Then again, my Johnson Viking One is still running fine every day, and it was built in 1950.

Regards,

Rob W1AEX

Elecraft does monitor their Elecraft list and are quick to ID hardware and software glitches and issue patches ASAP. Which makes sense because they sell kits and naturally people have a lot more problems assembling them, also other users on the list can help them ID problems and correct mistakes without every person with a problem calling Elecraft on the phone or via email for help.

Good grief! What a flash back... Does anyone else remember Compuserve? Many companies had their own forums to handle questions or to just listen to suggestions and complaints.

Too bad those days have gone away.

I think not...at least, not in this stage of the postings....

In fact, I think the reminiscing is interesting!

If the topic doesn't die in a few more days, then I should think the topic has been beaten to death and the discussion would be circular by nature.

As for the original question...I would bet that 'someone' from Yeasu's tech support team IS a member here, but...as has been said earlier, no way would they let that fact be known.

Subject: RE: [FT897] Re: EEPROM write dangers?

DRAMs do not have limits on read or write operations. Some EEPROMs do not have limits on read operations.

A serial port sniffer will not allow you to determine how frequently the software running on your transceiver' s microprocessor emits EEPROM write operations. You either need the source code for this software, or you need a way of monitoring the EEPROM - e.g. with a scope or a logic analyzer. If you perform this assessment, please share your results here.

Sent: Saturday, 22 August, 2009 16:55:21
Subject: RE: [FT897] Re: EEPROM write dangers?

1. I don't recall seeing a limit on read operations in the spec for the EEPROM used in the FT-897

2. If you peruse Clint KA7OEI's web page - specifically the memory layout - you'll see that there are many parameters stored in EEPROM

3. Unless you have access to Yaesu's source code or have monitored the EEPROM with a scope or logic analyzer, you have no idea at what frequency EEPROM write operations are performed by the code embedded in the FT897. Thus you do not know whether additional EEPROM writes generated by software using the undocumented CAT instruction are or are not problematic.

EEproms memory also has a read limit too. It's higher than the write limit but the system writes to the eeprom when you set a memory or turn the machine off. Telling nt to write to something at all that allows a million or so write cycles before it starts to fail even if it does then is panic spreading. likely my 897 will not last as long as its eeprom

Subject: RE: [FT897] Re: EEPROM write dangers?

Rob, as I have pointed out (repeatedly) , the absence of failures to this point in time only means that the limit has not yet been reached. It tells you nothing about when the limit will be reached.

Given this uncertainty, I advise users of FT817s, FT857s, and FT897s to not use the undocumented "write to EEPROM" CAT command; those that do so anyway at least understand the risk they are taking, the magnitude of which lies somewhere between negligible and signficant.

I'll leave the thrill of contacting Yaesu to those who advocate the use of the undocumented "write to EEPROM" CAT command. I'd be happy to learn that there's no risk, but until then I'll control my FT-817's RF power level by hand.

David,

How many 897/857's have failed from EEPROM failure? I have read the entire thread and fully understand the concepts discussed, but the reality is that in the field, the rigs are not failing from the utilization of rig control software. I would suggest you bring your concerns regarding this topic to Yaesu. Ask them how many EEPROM failures have turned up in their service centers. Until you have facts to present regarding actual failure rates, everything else stated in this thread is unsubstantiated speculation.

27467. RE: [FT897] Re: EEPROM write dangers?

Yahoo group: FT897 (2009)
Date: 2009-08-23 02:47:02 UTC
From: Dave AA6YQ
Topic: 27393 Message: 27467

There is no "wear and tear" involved in moving charge to and from a one-transistor cell in a dynamic random access memory (DRAM). To confirm this, read any introduction to semiconductor physics.

Your serial port sniffer will not show you any of the EEPROM writes generated by the code running on the processor embedded in your transceiver. I will not repeat this basic and obvious point again.

The specification for the EEPROM used in the FT897, whose URL I posted earlier in this thread, states that it's good for 1 million write/erase cycles. Until you know the rate at which Yaesu's code running on the processor in your transceiver emits EEPROM writes, you don't know how many of those 1 million write/erase cycles have already been consumed, and thus you don't know what risk you are taking by running PC software that initiates additional EEPROM writes via the serial port. A sequence of logical deductions based on incontrovertible fact (the limit cited in the spec) *is* a proof.

Hi Bill!

I don't mind reading it either, and it is certainly not offensive.?? The point being made is that it is off topic.? This not an Elecraft list nor a Compuserve list, etc.? These things can be discussed elsewhere and many people join this list wishing to learn about and share their experiences with the FT-897.? I can understand their desire not to have other topics in the way.? The discussion about wether there are any Yeasu employess on the list is not too far off, but it has diverged even futher than that.

Subject: RE: [FT897] Re: EEPROM write dangers?

There is no "wear and tear" involved in moving charge to and from a
one-transistor cell in a dynamic random access memory (DRAM). To confirm
this, read any introduction to semiconductor physics.

Your serial port sniffer will not show you any of the EEPROM writes
generated by the code running on the processor embedded in your transceiver.
I will not repeat this basic and obvious point again.

The specification for the EEPROM used in the FT897, whose URL I posted
earlier in this thread, states that it's good for 1 million write/erase
cycles. Until you know the rate at which Yaesu's code running on the
processor in your transceiver emits EEPROM writes, you don't know how many
of those 1 million write/erase cycles have already been consumed, and thus
you don't know what risk you are taking by running PC software that
initiates additional EEPROM writes via the serial port. A sequence of
logical deductions based on incontrovertible fact (the limit cited in the
spec) *is* a proof.

Subject: RE: [FT897] Re: EEPROM write dangers?

DRAMs do not have limits on read or write operations. Some EEPROMs do not have limits on read operations.

A serial port sniffer will not allow you to determine how frequently the software running on your transceiver' s microprocessor emits EEPROM write operations. You either need the source code for this software, or you need a way of monitoring the EEPROM - e.g. with a scope or a logic analyzer. If you perform this assessment, please share your results here.

So, if the 897 code writes the same value already stored in a memory location back into it, does your "sniffer" tell you that a write has occurred? If a value is changed, then quickly changed back to the earlier value, does your "sniffer" tell you that? I'm not sure what your "sniffer" is, but does it really monitor all writes, or does it just compare snapshots of the memory taken at different times?

Posts such as this garbage up the list more then the slightly off-topic posts. So far there are seven posts in the original topic and five in the "OFF TOPIC!" one.

This is a moderated group with a moderator who does an admirable job of providing enough leeway while stopping threads when they need to be. Without a moderator this list would succumb to constant bickering with little value. It is his decision about stopping threads that matters, not mine or others. If you have some fundamental disagreement with his handling of this, I suggest that you address it with him in private.

How hard is it to delete unwanted messages? I take me about two seconds to skim a post in a thread that doesn't really interrest me to see if they have strayed into my interest areas. There are thousands of people in this group. Not all of them have the same interests. Very few are interested in reading posts of somebody yelling "OFF TOPIC!"

Everybody, please let people discuss what they feel is important and ignore posts that you don't find of interest. This is a wonderful resource, but of late it has been muddied by people feeling some deep need to police it. It takes less energy and causes less frustration to just click on a delete button or one the next message. If it makes you feel better, add some verbal sound effects when you click on the delete button.

Offline, perhaps you will explain exactly what wears out in a dynamic RAM. I designed several commercial computers during the 1970s and 1980s that implemented main memory with DRAMs, many of which are still deployed and running. There are cells in those DRAMs that have been read and written literally billions of times without a permanent failure (soft errors from alpha particles are not a "wear and tear" issue). What wear mechanism becomes manifest after billions of operations?

What are you using for an 897 sniffer? Have you used it to measure the rate at which Yaesu's code generates write/erase operations? A reliable measurement would eliminate the uncertainty we've been discussing.

If an EEPROM of the type used in an FT-897 were to lose its write/erase capability after fewer than 1 million write/erase operations, the part would be considered out-of-spec and thus defective.

Yes, I am not sure what has happened to this group, it seems to have been taken over by the 'Off Topic Police' who wish to censor everything that is posted to fit in with their ideas of what is interesting.

There are obviously enough group members interested in these topics, and as long as they are not abusive why should they not continue? Why should we allow a few vocal complianers to censor what is being posted, and what is actually of interest to a substantial number of *Group Members*, who probablly out number the complainers.

It is very simple; if you are not interested in a thread then *don't read it*, why is that such a problem?? It is not as though there are reams of off-topic threads, the odd one or two can actually be quite interesting, and most of them develop out of on-topic subjects, so are usually almost on-topic, rather than being about completely different subjects.

As a new member to this forum I've never seen such moaning, back biting and general nastiness in a forum, and it all seems to stem from a couple of individuals.

The funny thing is, that when the Off-Topic Police post it generates even more so-called off-topic replies to their moaning, rather than their goal of quelling a thread.

I can only suggest that the Off-Topic Police complain only to the moderator directly and not here. By your posting you're taking up valuable space :)

27476. Re: [FT897] Re: EEPROM write dangers?

Yahoo group: FT897 (2009)
Date: 2009-08-23 11:44:47 UTC
From: Darren S
Topic: 27393 Message: 27476

Without seeing the source that's not exactly easy to establish but i can tell you one thing. The emphasis on all documentation i've come across which in all fairness isn't a lot does establish that the done thing is to do a read then change only what needs changing if anything and if nothing neeeds changing then don't write back. It's common sense. The yaesu embedded programmers would know that eeprom writes and mpu programme memory writes for that matter are finate and they would have this in mind when writing thier firmware.

So, if the 897 code writes the same value already stored in a memory location back into it, does your "sniffer" tell you that a write has occurred? If a value is changed, then quickly changed back to the earlier value, does your "sniffer" tell you that? I'm not sure what your "sniffer" is, but does it really monitor all writes, or does it just compare snapshots of the memory taken at different times?

Dynamic ram is volatile and designed to be hit repeatedly but even that goes pop. I've just had to change a memory stick on my lab machine because the old one wore out.Wear and tear.

From: Dave AA6YQ <aa6yq@...>
To: FT897@yahoogroups.com
Sent: Sunday, 23 August, 2009 6:39:25
Subject: RE: [FT897] Re: EEPROM write dangers?

Offline, perhaps you will explain exactly what wears out in a dynamic RAM. I designed several commercial computers during the 1970s and 1980s that implemented main memory with DRAMs, many of which are still deployed and running. There are cells in those DRAMs that have been read and written literally billions of times without a permanent failure (soft errors from alpha particles are not a "wear and tear" issue). What wear mechanism becomes manifest after billions of operations?

What are you using for an 897 sniffer? Have you used it to measure the rate at which Yaesu's code generates write/erase operations? A reliable measurement would eliminate the uncertainty we've been discussing.

If an EEPROM of the type used in an FT-897 were to lose its write/erase capability after fewer than 1 million write/erase operations, the part would be considered out-of-spec and thus defective.

Sent: Sunday, 23 August, 2009 3:47:02
Subject: RE: [FT897] Re: EEPROM write dangers?

There is no "wear and tear" involved in moving charge to and from a one-transistor cell in a dynamic random access memory (DRAM). To confirm this, read any introduction to semiconductor physics.

Your serial port sniffer will not show you any of the EEPROM writes generated by the code running on the processor embedded in your transceiver. I will not repeat this basic and obvious point again.

The specification for the EEPROM used in the FT897, whose URL I posted earlier in this thread, states that it's good for 1 million write/erase cycles. Until you know the rate at which Yaesu's code running on the processor in your transceiver emits EEPROM writes, you don't know how many of those 1 million write/erase cycles have already been consumed, and thus you don't know what risk you are taking by running PC software that initiates additional EEPROM writes via the serial port. A sequence of logical deductions based on incontrovertible fact (the limit cited in the spec) *is* a proof.

To: FT897@yahoogroups. com
Subject: Re: [FT897] Re: EEPROM write dangers?

they all have limits. It's physics. the law known as wear and tear.
The serial sniffer tells me what commands are being snet to the 897 and my 897 sniffer tells me whats in the eeprom and what has changed.

The point that eeproms pop at the drop of a hat is yours and hence your to offer proof to back up. You have offered none.

Subject: RE: [FT897] Re: EEPROM write dangers?

DRAMs do not have limits on read or write operations. Some EEPROMs do not have limits on read operations.

A serial port sniffer will not allow you to determine how frequently the software running on your transceiver' s microprocessor emits EEPROM write operations. You either need the source code for this software, or you need a way of monitoring the EEPROM - e.g. with a scope or a logic analyzer. If you perform this assessment, please share your results here.

Sent: Saturday, 22 August, 2009 16:55:21
Subject: RE: [FT897] Re: EEPROM write dangers?

1. I don't recall seeing a limit on read operations in the spec for the EEPROM used in the FT-897

2. If you peruse Clint KA7OEI's web page - specifically the memory layout - you'll see that there are many parameters stored in EEPROM

3. Unless you have access to Yaesu's source code or have monitored the EEPROM with a scope or logic analyzer, you have no idea at what frequency EEPROM write operations are performed by the code embedded in the FT897. Thus you do not know whether additional EEPROM writes generated by software using the undocumented CAT instruction are or are not problematic.

Subject: Re: [FT897] Re: EEPROM write dangers?

EEproms memory also has a read limit too. It's higher than the write limit but the system writes to the eeprom when you set a memory or turn the machine off. Telling nt to write to something at all that allows a million or so write cycles before it starts to fail even if it does then is panic spreading. likely my 897 will not last as long as its eeprom

Subject: RE: [FT897] Re: EEPROM write dangers?

Rob, as I have pointed out (repeatedly) , the absence of failures to this point in time only means that the limit has not yet been reached. It tells you nothing about when the limit will be reached.

Given this uncertainty, I advise users of FT817s, FT857s, and FT897s to not use the undocumented "write to EEPROM" CAT command; those that do so anyway at least understand the risk they are taking, the magnitude of which lies somewhere between negligible and signficant.

I'll leave the thrill of contacting Yaesu to those who advocate the use of the undocumented "write to EEPROM" CAT command. I'd be happy to learn that there's no risk, but until then I'll control my FT-817's RF power level by hand.

David,

How many 897/857's have failed from EEPROM failure? I have read the entire thread and fully understand the concepts discussed, but the reality is that in the field, the rigs are not failing from the utilization of rig control software. I would suggest you bring your concerns regarding this topic to Yaesu. Ask them how many EEPROM failures have turned up in their service centers. Until you have facts to present regarding actual failure rates, everything else stated in this thread is unsubstantiated speculation.

73,

Rob W1AEX

Yes, I am not sure what has happened to this group, it seems to have been taken over by the 'Off Topic Police' who wish to censor everything that is posted to fit in with their ideas of what is interesting.

There are obviously enough group members interested in these topics, and as long as they are not abusive why should they not continue? Why should we allow a few vocal complianers to censor what is being posted, and what is actually of interest to a substantial number of *Group Members*, who probablly out number the complainers.

It is very simple; if you are not interested in a thread then *don't read it*, why is that such a problem?? It is not as though there are reams of off-topic threads, the odd one or two can actually be quite interesting, and most of them develop out of on-topic subjects, so are usually almost on-topic, rather than being about completely different subjects.

And that's just the point - you ought to be able to drift a bit when something strikes you as interesting. That's been the fun of ham radio for me, not knowing where a conversation will go when I meet someone for the first time on the air. Am I terribly interested in how many read/write cycles ... nah. But would I want conversations like this to go away ... not at all. Maybe I'll learn something.

The thing that - I hope - will come out of all this back and forth about off topic posts is the realization that ham radio is a diverse hobby, filled with people with varied backgrounds and skill sets. There usually is, and ought to be, a common bond with all of us - despite the diversity of backgrounds - that pulls us together. Besides, there always will be conversations - here and at a friend's house - that move off on a tangent. We're not delivering a formal paper here, so excursions - within limits - ought to be welcomed.

Heck, let us talk. Worse case we'll learn something. The neat thing is that I can skip over topics that don't interest me, or leave the group altogether if I find it to be a waste of time. It is not difficult to do either one. But while we're here I hope we can talk in a civil way - as you're doing and most of us try to do. Let the regular members talk, let the moderators moderate. Some small sense of humor helps too.

27480. RE: THIS IS OFF TOPIC! PLEASE STOP Re: [FT897] Re: Yaesu employee??

Yahoo group: FT897 (2009)
Date: 2009-08-23 13:21:23 UTC
From: Bruce Krell
Topic: 27463 Message: 27480

I hardly see how the issue of Yaesu and its participation is off topic.
Yaesu makes the radio.
They know the most about the radio.

I have had experiences trying to get information from Yaesu/Vertex.
They have been marginally helpful. The tech support guys are
OK, but their knowledge about what is happening inside the
radio is so limited as to be frustrating.

Yaesu/Vertex doesn't want its engineers to be bothered by millions
of silly questions (in their opinion) so they force all communications
through tech support. In my opinion, this hurts their sales but
I don't depend on their sales for my income, so maybe I don't know
what I'm talking about. (That was sarcastic -- I'm an engineer
and always visibility participated in large user communities).

But there is a benefit to us for bringing up this topic of Yaesu/Vertex
participation. Even if a Yeasu/Vertex employee doesn't identify himself,
there is at least one who is monitoring this mail list.

So, if he/she reads our frustration, maybe they'll get the message
to Yaesu/Vertex management and get the engineers to get out
of their cubbyholes and talk to the rest of us who actually use
the equipment.

So, again, I think that this issue of Yaesu/Vertex involvement
in a forum like this is directly on topic. After all, isn't our goal
to foster communications about the radio? And, wouldn't
demonstrating wide disatisfaction with the palpable publc
silence of Yaesu/Vertex in a large public forum about their
product perhaps encourage them to participate in more
communication with us?

I'm new to the FT-897 and this group but have been a HAM for 8 years. I've been reading threads that extol the dangers of writing to the EEPROM on the radio. Can someone please list the "dangerous" commands so I can avoid inadvertently damaging my new radio??

I've already shut off the sliders on HRD (I like the program) and am wondering if there are any other commands to avoid.

Besides the ADMS software, which is great for my HT but I'm not so sure about the 897, what would the group recommend for programming and/or control software. I know HRD won't program memories but I'm not sure if the ADMS will do more than manage the memory.

Your help and comments are appreciated

27482. Message to Yassu (formerly Re: [FT897] Re: Yaesu employee??)

Yahoo group: FT897 (2009)
Date: 2009-08-23 15:21:17 UTC
From: Lew Phelps K6LMP
Topic: 27463 Message: 27482

Let's assume for the sake of discussion (because Bruce is correct with a 99%+ probability) that somebody from Yaesu monitors this list.

Let's further assume that the Yaesu person is actually passing information up the line to people who make decision about how the radio is designed and supported.

What would we like to tell them? Here are my contributions to the list:

1. Fusing the CAT/LINEAR port with a tiny SMD fuse is beyond stupid. Fuses are designed to blow. It shouldn't require a trip to the shop (or a relatively uncommon skill among hams to be able to work with SMD devices)) to remove and replace a simple fuse.

2. The front of the rig needs to be redesigned to provide real mechanical protection for the knobs/dials that protrude and are vulnerable to damage (and a trip to the shop) to replace. Given the rig's intended use, such vulnerability is unacceptable. The "ultra-rugged" appearance of the FT-897 is a ruse.

3. Many on this group have complained about/experienced RF feedback into the mike, particularly on six meters, and particularly using DTMF microphones. How about acknowledging this flaw and providing a user-installable fix, or free fix at the factory?

4. Some have experienced RF blowing out the auto-keyer. Again, how about a user-installable fix, or free fix at the factory?

5. Could Yaesu please provide the Type N panel jack with a two-screw mount in its U.S. inventory? The part is standard outside the US, and many would prefer to use a Type N panel jack for their UHF antenna port, but Yaesu doesn' make it available to North American users, even as a spare part. (Mouser carries it, but it is a non-stocked item. Digiey doesn't list any such iten.)

I'm sure others can greatly expand this list.

Then you think the 897 should write this info every turn of the knob? I assume this state to be recalled if a power outage interupts your radio session.

Or only when the knob to change bands is invoked.

Thanks for asking that question but I'll leave that to the boffins at Yaesu and see what they think best, although I guess just when moving to a different memory group would be fine.

BTW, I did make a mistake in my original post. I said when changing memory groups it always goes to memory 00 in the new group, I should have said 01. Also, I should have added '*or the lowest numbered used memory in the new group*'.

From: DavidN
Topic: 27393 Message: 27484

I'm a little confused by some of the comments made on this topic. I've always understood that flash memory has a problem with memory wear. This problem is even more important nowadays with the introduction of SSD-only minbooks (Elonex, CnMLifestyle etc) which don't have a hard drive, just memory.

So I do wonder if the same must be true of EEPROMs? The wiki for flash memory says:

Another limitation is that flash memory has a finite number of erase-write cycles. Most commercially available flash products are guaranteed to withstand around 100,000 write-erase-cycles, before the wear begins to deteriorate the integrity of the storage.

The wiki is here:

http://en.wikipedia.org/wiki/Flash_memory

Have a look for* Memory Wear*, almost half-way down the page.

USB support/socket/port.

Computer package:

Offer an optional package with ALL the (optional) cables/software included.

Mobile package:

Phase two of the above, Packge to include the ATAS 120 w/mount.

Desktop package:

Phase three: Desktop with all the acc.

I know these wont be as sweet as what you might put together, so get some partners like IBM or Microsoft did and offer their acc too, in packages.

Ditto on the front face gaurd.

- Definitely USB support/socket/port
- SD card slot for easy saving of parameters and memories (could then put the SD card into another Yaesu with your preferences (CW speed, tone etc etc) and off you go)
- MTUNE step follows programmed step size and not stick at 2.5kHz

Thinking.... :)

Clint KA7OEI's reverse engineered map of the 817/857/897 EEPROM shows that all radio state is stored in the EEPROM. Consider VFO selection, for example. Each time you switch VFOs, an EEPROM write/erase is initiated. We know this because an EEPROM read initiated via the serial port reveals it to be the case. If it weren't the case, the transceiver control application you're using wouldn't update its "current VFO selection" display when you switch VFOs from the rig's front panel. What we don't know without source code or a logic/bus analyzer is the extent to which internal bookkeeping results in a continuous EEPROM write/erase cycles independent of operator-initiated changes in state. Keep in mind that the developer of Yaesu's code would assume a lifetime budget of a million write/erase cycles. Who knows what he or she assumed about the transceiver's lifetime.

If you truly have an FT-897 sniffer as you stated in your previous post, then you should be able to measure the rate of EEPROM write/erase cycles in equilibrium (with no changes in state induced via the front panel or CAT interface). That would eliminate the uncertainty and hopefully put a lot of 817/857/897 ops at ease.

Subject: Re: [FT897] Re: EEPROM write dangers?

Without seeing the source that's not exactly easy to establish but i can tell you one thing. The emphasis on all documentation i've come across which in all fairness isn't a lot does establish that the done thing is to do a read then change only what needs changing if anything and if nothing neeeds changing then don't write back. It's common sense. The yaesu embedded programmers would know that eeprom writes and mpu programme memory writes for that matter are finate and they would have this in mind when writing thier firmware.

So, if the 897 code writes the same value already stored in a memory
location
back into it, does your "sniffer" tell you that a write has occurred? If a
value is changed, then quickly changed back to the earlier value, does
your "sniffer" tell you that? I'm not sure what your "sniffer" is, but does
it really monitor all writes, or does it just compare snapshots of the
memory
taken at different times?

How did you determine that the failure in your memory stick was "wear", as opposed to a latent manufacturing defect? A common cause of semiconductor failure is impurities in the substrate that migrate into an active region; this is not "wear", it's a failure to maintain the required purity during the manufacturing process.

Subject: RE: [FT897] Re: EEPROM write dangers?

Offline, perhaps you will explain exactly what wears out in a dynamic RAM. I designed several commercial computers during the 1970s and 1980s that implemented main memory with DRAMs, many of which are still deployed and running. There are cells in those DRAMs that have been read and written literally billions of times without a permanent failure (soft errors from alpha particles are not a "wear and tear" issue). What wear mechanism becomes manifest after billions of operations?

What are you using for an 897 sniffer? Have you used it to measure the rate at which Yaesu's code generates write/erase operations? A reliable measurement would eliminate the uncertainty we've been discussing.

If an EEPROM of the type used in an FT-897 were to lose its write/erase capability after fewer than 1 million write/erase operations, the part would be considered out-of-spec and thus defective.

Sent: Sunday, 23 August, 2009 3:47:02
Subject: RE: [FT897] Re: EEPROM write dangers?

There is no "wear and tear" involved in moving charge to and from a
one-transistor cell in a dynamic random access memory (DRAM). To confirm
this, read any introduction to semiconductor physics.

Your serial port sniffer will not show you any of the EEPROM writes
generated by the code running on the processor embedded in your transceiver.
I will not repeat this basic and obvious point again.

The specification for the EEPROM used in the FT897, whose URL I posted
earlier in this thread, states that it's good for 1 million write/erase
cycles. Until you know the rate at which Yaesu's code running on the
processor in your transceiver emits EEPROM writes, you don't know how many
of those 1 million write/erase cycles have already been consumed, and thus
you don't know what risk you are taking by running PC software that
initiates additional EEPROM writes via the serial port. A sequence of
logical deductions based on incontrovertible fact (the limit cited in the
spec) *is* a proof.

Sent: Saturday, 22 August, 2009 17:38:33
Subject: RE: [FT897] Re: EEPROM write dangers?

DRAMs do not have limits on read or write operations. Some EEPROMs do not have limits on read operations.

A serial port sniffer will not allow you to determine how frequently the software running on your transceiver' s microprocessor emits EEPROM write operations. You either need the source code for this software, or you need a way of monitoring the EEPROM - e.g. with a scope or a logic analyzer. If you perform this assessment, please share your results here.

Sent: Saturday, 22 August, 2009 16:55:21
Subject: RE: [FT897] Re: EEPROM write dangers?

1. I don't recall seeing a limit on read operations in the spec for the EEPROM used in the FT-897

2. If you peruse Clint KA7OEI's web page - specifically the memory layout - you'll see that there are many parameters stored in EEPROM

3. Unless you have access to Yaesu's source code or have monitored the EEPROM with a scope or logic analyzer, you have no idea at what frequency EEPROM write operations are performed by the code embedded in the FT897. Thus you do not know whether additional EEPROM writes generated by software using the undocumented CAT instruction are or are not problematic.

Subject: Re: [FT897] Re: EEPROM write dangers?

EEproms memory also has a read limit too. It's higher than the write limit but the system writes to the eeprom when you set a memory or turn the machine off. Telling nt to write to something at all that allows a million or so write cycles before it starts to fail even if it does then is panic spreading. likely my 897 will not last as long as its eeprom

Sent: Friday, 21 August, 2009 2:20:31
Subject: RE: [FT897] Re: EEPROM write dangers?

Rob, as I have pointed out (repeatedly) , the absence of failures to this point in time only means that the limit has not yet been reached. It tells you nothing about when the limit will be reached.

Given this uncertainty, I advise users of FT817s, FT857s, and FT897s to not use the undocumented "write to EEPROM" CAT command; those that do so anyway at least understand the risk they are taking, the magnitude of which lies somewhere between negligible and signficant.

I'll leave the thrill of contacting Yaesu to those who advocate the use of the undocumented "write to EEPROM" CAT command. I'd be happy to learn that there's no risk, but until then I'll control my FT-817's RF power level by hand.

David,

How many 897/857's have failed from EEPROM failure? I have read the entire thread and fully understand the concepts discussed, but the reality is that in the field, the rigs are not failing from the utilization of rig control software. I would suggest you bring your concerns regarding this topic to Yaesu. Ask them how many EEPROM failures have turned up in their service centers. Until you have facts to present regarding actual failure rates, everything else stated in this thread is unsubstantiated speculation.

73,

Rob W1AEX

From: w4wb
Topic: 27490 Message: 27490

Folks,

1. Please keep to the topic bounds provided in the Guidelines you received for this forum.

2. Kindly drop the "Yaesu employee" now.

3. It is fine to discuss what new features you would like to see in the FT-897D, as well as those that you find weak or useless.

4. Following the normal product development path of Yaesu, it is about time that the replacement for the FT-897D be introduced. Indeed there are "rumors" that such replacement is coming soon. If so, the feature set has been likely finalized at least a year ago. Word I received is that the replacement will be much more of a software defined radio, which would allow more feature flexibility and updating capability. The major ham radio show in Japan is going on this weekend, JARL Ham Fair 2009, and this is likely where the first actual announcement will be made. FWIW, they had about 29,000 attend last year and that is a lot more than went to the Dayton Hamvention.

5. And finally, if you don't like a thread or feel it is OT, then contact me directly. Please don't take it upon yourself to police the list. Remember, your DELETE key is a powerful tool to eliminate posts you don't care to read.

Rob,
this mod gives you a extra PA-PTT (switching to ground) at the ACC plug. You may need it if your plugs CAT/DATA are already in use like at me with the MicroHam DigiKeyer interface. If both are in use you can't switch you PA so you need that. If you don't use any digital interface use data/cat for switching you PA.Either if you don't have a PA you don't need that mod :-)

Topic: 27444 Message: 27497

By PA, do you mean Power Amp?

So let me see if I understand: Normally, this jack is an input. The ring on the ACC port normally causes the radio to transmit a continuous, unmodulated carrier for tuning. So by switching this jumper, is this now a PTT *output*, used to SEND a PTT request to a power amp?

If so, then that is useful. Of course, you lose the cool tuning functionality on that port, but you can still switch to AM or CW and key the radio.

Yes, but what are the specs on it, as in Q factor, etc.

For the W4RT, read this one http://www.w4wb.com/index.htm - but they don't seem to publish the shape factor. $134 if you are talking SSB.

For Inrad, review this one: http://www.inrad.net/product.php?productid=18 <http://www.inrad.net/product.php?productid=18&cat=126&page=1> &cat=126&page=1. The shape factor is 1.6. $145 for the 2.3khz SSB one.

Either will blow the Murata 4 cent filter that is installed out of the water. I bet you'll be hard pressed to tell the difference by ear.

Which bandwith filter is the preferred one for general SSB usage, and while keeping the stock FT897D SSB filter in the radio too..

I am thinking the Inrad filters.

Aren't they both the same filter module? W4RT or Inrad just mounts it
on a PCB. I would think that you're basically getting the same thing
from W4RT, Inrad, or Yaesu. the only difference is who's soldering the
filter to the board.

27506. Re: INRAD vs W4RT vs Yaesu

Yahoo group: FT897 (2009)
Date: 2009-08-25 04:22:29 UTC
From: w4wb
Topic: 27498 Message: 27506

All three use the identical filter ... part number is the same except the suffix is different which just means the label is different. Collins part # is 526-8739-010 (010 may be 020 or whatever). Has 10-poles, BW is 2.26 KHz @ -6 dB, and BW = 4.6 kHz @ -66 dB while the 526-8731-010 has 8-poles, BW is 2.00 @ -3 dB, and BW = 4.4 KHz @ -60 dB.

If you pay close attention to the numbers, you will notice that 526-8731 has a BW equal to about 2.2 KHz @ -6 dB. So these filters are rather similar except the 8739 has a bit better out of band rejection.

In practice when I have used both filters on-the-air, I found I liked the sound of the 2.26 (some round up to 2.3) filter over the 2.00 filter. OBJ is better IMHO as well.

You can see the measured performance of the W4RT 500 and 2260 filter in an article at http://www.w4wb.com/Reviews/QQ-Oct-01-Filter-Review.pdf .

Hi Tom,
yes now you have it 100% !
You are right you lose the tuning /ACC) function of the PA (power amplifier). As I use only 2m that 2m PA's has no need of the ACC
but if you have a short wave PA you may need it. Doing this mode it is now switching the PA in every mode not only AM/CW.

Good morning all, I have recently acquired an Ameritron AL-80B Amplifier. I wish to hook it up to my FT-897D. I also purchased a Palstar AT1500DT antenna tuner. My main concern is getting the correct wires to hookup the amp to the transceiver. What connection on the back of the FT-897 is used and what or where I can get the correct cables. I am a new ham and this is my first amp so please give me a little latitude on this simple question. Thank you all 73's

Tom

More on this, and please don't take it the wrong way. J

I would hold off on hooking up the Amplifier at this time. Running 100 watts is just fine for most things, however, amplifiers will drive you crazy with a number of issues like RFI, etc.

Until you get a feel for dealing with the RF/high voltages, etc. parts for HF, it might be better just to leave it on the desk looking like it is hooked up. Then, find an experienced ham who has used Amps before and have him teach you.

Amps are pretty simple to hook up. For the most part, you need some coax and the 1 PTT wire to key the amplifier. It is in your best interest to understand how the radio keys the amp and how the amp is keyed. It is pretty simple stuff, but it is very important that you comprehend what goes on.

I've been a ham since I was 14. Technology has always been my hobby. Even today, being active for over 35 years, having worked on Avionics, amps still are fickle. As an example, I installed a solid state SGC500 amp at my remote base. Fed it with a 70A 12 V power supply and a 100aH battery in parallel. Yet, it still trips off due to over current. It isn't due to RF or grounds. I'm still working on it, and I think I have it solved.

So, my 2 cents (which you didn't pay for), is to take some baby steps. Get the tuner working (or, better yet, get, build, antennas that are 50 ohm resonant so you don't need the tuner). I own a few tuners. All of them gather dust. Even here in my small backyard in the city of Toronto.

I know there are many others that will echo my thoughts. Baby Steps. <big grin>

27512. Re: Noise from OEM Battery charger

Yahoo group: FT897 (2009)
Date: 2009-08-25 16:51:14 UTC
From: kc9ipv
Topic: 27274 Message: 27512

Update.

Ok, I got the schematic from yaesu. They are using .1u (104) capacitors to filter noise on all 3 lines coming out of the charger. On pin 3 (charging voltage) there is an unused place for diode D5. I placed a .001u(102) cap there. On pin 6 (blue wire) I placed a .001u cap between it and pin 1 (ground). I straddled a .001u cap over C19 coming from the white wire at pin 5. This adds higher frequency filtering on all lines going to the battery.

When testing I found the noise greatly reduced and is barely audible and no longer shows up on the S meter with the exception of the 6 meter band. 6 is still giving me a very high noise level. 2 meters is fine and I didn't test UHF. I can live with 6 since I don't use it often and when I do I won't be using the internal batteries. I also still have the 6 RFI beads on the wire coming out of the charger.

To open the case feel around on the sticker. There are 2 torx screws back there. Then pinch the sides to pop it open.

While you have it open you might as well check the output voltage at pin 3 and adjust VR1 to set it to 16.5vdc

> > >
> > > I opened up the CD-24 this evening and put it on the scope and was amazed at just how

dirty the output really is. It also seems to be way over engineered for a charger. I'm going to try to add some filtering inside the case and see if I can clean it up. I emailed yaesu for the schematic but I'm not holding my breath. They give you the one with the radio why not the accessories?

27516. greeetings

Yahoo group: FT897 (2009)
Date: 2009-08-26 02:34:03 UTC
From: zephyrhawaii
Topic: 27516 Message: 27516

Hello everyone,

Am I glad to see that this group exists :) I just redeemed my expired ticket and upgraded. I plan to purchase my first HF transceiver in the not too distant future.

Which radios are the main competition against the 897D? I really like the 897D's features, even though I've never seen one in real life. Despite this, I want to compare it to its competition first before I hand over my hard-earned greenbacks.

I plan on doing mostly base and portable work, and maybe a little mobile later. My main modes for now will be morse and voice, but I plan to get into other modes later.

Also, which accessories (power supplies, antennas, keyers, etc.) work best with the 897D? I know it would be easy to purchase all Yaesu accessories along with the radio, but I know there are lots of good aftermarket products out there. I want the most bang for the buck, because of my small budget.

Thanks for having me in your group.

From: Lew Phelps K6LMP
Topic: 27516 Message: 27517

If having VHF/UHF capability in a single rig along with HF, the 897 is an excellent choice.

If HF is your primary focus, and you don't care about 2 meters/440 (or are planning to add your "mobile" capability with a 2M/440 pure mobile rig later on), then I would also take a serious look at the Elecraft K2 and K3. The former model is older, smaller, and less costly, and comes either assembled or in a kit. The newer K3 has the best performance figures of any rig I've seen reviewed in QST, and draws rave reviews generally. It's small enough for "portable" use, and operates on 12 VDC, which means you can run it from a vehicle battery. Either the K2 or K3 can be "brought into" VHF-land with separate transverters that Elecraft sells that will provide all-mode coverage in every ham band through 440.

I am very happy with my 897D, but if a thousand dollar bill fell from the sky with a note attached to it saying "spend on ham gear," I'd buy an Elecraft K3 in a heartbeat.

In terms of aftermarket products, there's pretty widespread agreement on this group that the Yaesu autotuner is not as good as the LDG AT-897.

Thanks, Lew. Yes, I want to have everything in one box for now because I plan to get on VHF and UHF as well. Thanks for the tips though. I'll remember the part about the tuner :)

For an "all in one box" radio, you can't beat the FT-897D. I have two of them. Lew is right about the Yaesu FC-30 tuner. It's garbage. The LDG AT-897 ain't as pretty but it has a 10:1 tuning range as opposed to the 3:1 range of the FC-30. I know; a friend of mine has an FC-30 on his FT-897D. Don't go there.

I'm not really a DX chaser, but I've talked to New Zealand and a whole flock of other places on my 897D with a Hustler 5-BTV vertical on my metal roof (with no radials) from my house in North Central Texas.

It's a great radio. Could you do better with a K3, or an FT DX 9000D, or an Icom 7800? Probably. But not for the same money.

Give it a shot. You'll love it. I love both of mine.

I dont know anything about the compition, Iam a Yaesu user only. I do have 3 897's Love that radio. If you want an all in one radio I dont know if you can do much better. To go portable without a seperate power supply and tuner and have the wires hanging all down and all over, I went with the internal power supply (batteries also), and the LDG bolt on the side tuner. (watch out for the FC30 yaesu tuner, do your research on that. I had one and it is not a very wide tuner). Now how much more compact can you get to "pick it up and go" not to mention it also does vhf/uhf.....sorry I guess that is not exactally what you askd.

From: Noel Zeibari
Topic: 27522 Message: 27522

Hi all,

I want to thank Erwin DK5EW for uploading the modification on how to activate the (PA) Amplifier.
I did the modification per his instructions and my Amplifier is working perfectly.
The ring on the 1/8" plug is ACC. and the other end RCA plug is attached to the Relay of amplifier. According to Erwin, there is no need to hook anything on the ALC Jack of the amplifier.

The manual for my Z-11 suggests installing a 6 AA holder inside the tuner. If I was going to run portable, I'd do that, rather than draw power from the radio.

Tom,

The early AT-100Pros showed in the manual that it would run off from 6 AA batteries, but we've since changed it to 8 AA batteries to give it a little better voltage margin.

As per LDG manual the AT-100 Pro consumes a minute amount of power and
once it it completed its tuning cycle the power can be disconnected.

Is there a pin out for the FT-897 battery ? The one that looks like a
microphone connector?

Thanks de John K0CQW

27527. FT897 memory map

Yahoo group: FT897 (2009)
Date: 2009-08-26 20:12:09 UTC
From: Trixter aka Bret McDanel
Topic: 27527 Message: 27527

I am working on a series of tools, mostly it is just a distraction from doing any real work. I have written a tool (perl script) that will dump the eeprom from the radio, and am now in the process of trying to document what is where in the eeprom dump. I have placed this on my webpage at http://www.0xdecafbad.com (the latest two entries at the time of this email).

I want to have a complete memory map, and was wondering if anyone had done this and would be willing to share that information. Even if it is not complete since I only started doing this yesterday anything is likely to be more than I already have.

Thanks,

kc2dwq

27528. CAT System on the MIC socket for Yaesu FT-897/857

Yahoo group: FT897 (2009)
Date: 2009-08-26 18:38:23 UTC
From: iz0inx
Topic: 27528 Message: 27528

Hi everybody, I've just added a file that describes how to replicate the CAT functionality on the Mic plug.
I't very useful as it allow the CAT connection even if the CAT/Linear socket on the rear panel is alredy used for other devices (i.e. the FC-30 or FC-40 Tuner)

The file is named CAT-Mic.doc and is located in the Files section, here:
Files > CAT & Sound Card Interfaces > Just CAT converter

If someone think that that's not the right place just let me know, I will move it to the proper one.

I'll appreciate any comment

> <http://www.ka7oei.com/ft817_memmap.html>

Thanks, I have seen that but since its for the 817, and not the 895 some things are different which means that its not valid to just translate addresses from one to the other.

For example (comparing that page and mine):
2E 40 VHF-HI
2F 41 VHF-L3
30 42 VHF-L2
31 43 VHF-L1

(mine)
00:2e VHF-PO-MAX
00:2f VHF-PO-MID
00:30 VHF-PO-MIn

There are 4 settings for VHF power in the 817, only 3 in the 897. This then skews the memory map from that point on (it appears to be the same up to that point though).

The same is true of UHF and possibly other things.

for reference my memory map, which is far from complete is at http://www.0xdecafbad.com/?p=154

Basically I have a perl script (should work in windows as well as osx, linux, etc) that dumps the eeprom and I diff after making 1 change, so its a long boring process, and I was hoping to avoid duplicating any work that has been done, but its looking like I might have to.

Thanks again,

kc2dwq

Thanks, I have seen that but since its for the 817, and not the 895 some things are different which means that its not valid to just translate addresses from one to the other.

For example (comparing that page and mine):
2E 40 VHF-HI
2F 41 VHF-L3
30 42 VHF-L2
31 43 VHF-L1

(mine)
00:2e VHF-PO-MAX
00:2f VHF-PO-MID
00:30 VHF-PO-MIn

There are 4 settings for VHF power in the 817, only 3 in the 897. This then skews the memory map from that point on (it appears to be the same up to that point though).

The same is true of UHF and possibly other things.

for reference my memory map, which is far from complete is at http://www.0xdecafbad.com/?p=154

Basically I have a perl script (should work in windows as well as osx, linux, etc) that dumps the eeprom and I diff after making 1 change, so its a long boring process, and I was hoping to avoid duplicating any work that has been done, but its looking like I might have to.

Ok, well then there will be one for the 897 as soon as I finish it. :)

I am publishing it as I work, and would gladly accept any contributions
that anyone feels like contributing (it would mean that it gets done
much faster). The memory map and the perl script I am using to do the
CAT dump of the 897 are both on my blog, free to all.

27535. FT897 memory map - progress

Yahoo group: FT897 (2009)
Date: 2009-08-27 12:39:06 UTC
From: Trixter aka Bret McDanel
Topic: 27535 Message: 27535

I have about half the work done, thanks to the help of some other list members who contributed the info they had. I encourage anyone who wants such a list to help participate in creating it.

Tomorrow I plan on writing a tool that will let you back up your factory alignment data (the "hidden" menu), which you will be able to print out and keep it with your manual or whatever. These settings are unique for each radio, so it is a good thing to have them written down at least (no matter what you are doing with the radio). I will be publishing the source code for the program free of charge on my site, as a service to the community.

By writing this tool I wont have as much time to map out the memory, why I am asking for help :)

> microphone connector?
>

I appear to have stumbled into the middle of this (I subscribed only yesterday) so I dont know if this is what you are looking for exactly or if its been offered before and you wanted something else.

Pin 1 Black Battery Negative also Black wire to radio 3 pin plug.
Pin 2 Yellow Connected to pin 4 (Charger reads pins 2 & 4)
Pin 3 Red Battery Positive also Red wire to radio 3 pin plug.
Pin 4 Yellow Connected to pin 2 (Lets charger know it is connected)
Pin 5 Blue Straight through to Blue wire Charge LED on radio 3 pin plug.
Pin 6 White To thermister 10k Ohms 20 degrees Celsius (Overheat Sensor)

Note: Pin 5 is 5 volts to LED in radio (Maybe even less)

THE GREATEST !!
Search for QST april 2007, and you will see Nenad Rotter, 9A5AN article (product) page 64.
The name is " A Microphone Port for Those Sound Card Modes".
This is for mike CAT port and also for mike.
The article is a complet one, with schematics, explanations and PCB.

For me is THE BEST !

And ebay is often overpriced! However, you can pick up some real bargains there also. Most of the overpriced stuff is new radios with a buy it now on it for 150% of what you could get one for at any amateur dealer.

If you're patient you can find a great deal like the one I got...
* FT-897D transceiver unit
* One LDG AT-897 Autotuner
* One FP-30 Power Supply
* Two FNB-78 NI-MH batteries
* One CD-24 Battery Charger
* One PA-26B AC adapter
* One YF-122C Collins CW Filter
* One YF-122S Collins SSB Filter
* One MH-31 Microphone
* All included paperwork
* Various Cables (power, 3.5mm Jack)

All brand new, sealed in the boxes... I paid $1100.00.
online price was $1959.56 @ hamcity.com, I have the invoice.
Just remember, if you don't buy it from a Yaesu Dealer, There is no warranty. But you can get a 4 year warranty from Squaretrade.com for about $100.

it is my belief, and I have no proof of this, did absolutely 0 investigation into it, have no studies or facts to cite, but I do have a blog so that makes me qualified to write on anything (that is the rule right??)...

People sell used ham radio gear based on depreciation of the price they paid, so early adopters want what becomes the retail price for new (or more) a year or two after a rig comes out. So they want say 75% of what they paid, regardless of what a new one goes for now.

I have noticed that used gear often is about equal to new, sometimes more than new, and that is the only thing I can think of that justifies that price.

You're correct Florentin, we can't share the article here.
But maybe some very kind OM could scan it and send it directly to my mailbox ... :-)

By the way, Fred, thanks again for sending me the tiff of the PCB, it is actually the only thing that is available from the ARRL site and, as member, I already got it. The problem is the article, the text.

cheers,

Wouldn't it be simpler to just attach a short piece of UTP wire to an
RJ-45 and wire the TX and RX lines to a Mini-DIN-8 jack? I'm assuming
that the QST article has a level converter in it, which we don't need
if we already have a CAT cable.

Yes Tom, I believe yours is another way to do that... even if it is not clear to me where to connect the Mike at this point.

You are correct about the article, a MAX232 is used as level converter. I actually don't need it as I already have a CAT/audio/Ptt/CW interface which does that.
Anyway, the 9A5AN's solution is very nice because the small board also includes a headset interface.

I got a similar deal (only without the filters) with shipping and handling for $1028.00 from a fellow Amateur Radio operator via eBay and I am loving it. I run it ot a G5RV and the AT-897 tunes it beautifully. Later I may upgrade antenna, but for now I am running PSK-31 at 25 watts to South America so can't complain too much about the G5RV. The deals are there on eBay if you don't mind used equipment.

27559. FT897 cross platform alignment backup tool

Yahoo group: FT897 (2009)
Date: 2009-08-28 02:29:15 UTC
From: Trixter aka Bret McDanel
Topic: 27559 Message: 27559

I wrote a FT897 (presumably 857 too since its the same internals)
alignment configuration backup tool today. It is cross platform and
open source (MPL licensed). It is a perl script so it should be easy
for most people to modify to suit their needs.

It will only display in human readable format the settings with the
intention that you will print them out and save them just in case you
ever need them. A working CAT cable is required to interface with the
radio.

I do not have a windows box to actually test that it works in windows
(if it does not work it will exit with an error about not being able to
access the com port), but I believe that the code is correct to allow
for it to work there.

It uses very basic perl modules, so it should work most everywhere that
perl works.

It may be downloaded at http://www.0xdecafbad.com/?p=184

27561. MMB-80 car mounting bracket

Yahoo group: FT897 (2009)
Date: 2009-08-28 03:31:32 UTC
From: Trixter aka Bret McDanel
Topic: 27561 Message: 27561

I am looking into the MMB-80 or really any suitable car mounting bracket for the 897 (no bolt on tuner). I am particularly interested in opinions about the bracket, with emphasis on the rig being occasionally in the car, but also removed and used in the house, field, etc.

I am most interested in a "quick disconnect" mindset so that I can remove and install it quickly, particularly without tools. It does not have to be the Yaesu one specifically, but it should be well suited for the 897.

Looking at the diagrams it appears that the screws are not suitable for easy toolless removal, but they appear to be easily replaced with "thumb screws" so I can do it quickly and easily. Can anyone who has this mounting bracket confirm this??

How secure does the bracket mount? I was looking where I would do this in my truck and it appears that the best place is the leading edge of the console, so the display would be the "top", however I do not know if this is suitable with that bracket, or could easily be made suitable for that bracket (maybe getting longer bolts and a steel plate/bracket on the inside of the console).

Thanks,

kc2dwq

Mark,

First of all, I'd like to invite you over to the Yahoo Screwdriver Group! Secondly, A screwdriver would work anywhere, but you'll need a decent counterpoise that is normally provided by a automobile body and frame. I would think you could put chicken wire down in the grass around the tree and let it eventually disappear into the grass or some thin radials spread out and get them into the ground so they will stay down. Or just unroll a length of wire equal to the lowest frequency you'll operate.

I have downloaded the script and I will try to test it within the next day as soon as I can get Win32::SerialPort installed via CPAN. I have a one piece USB to CAT cable for my FT-897D so I just need to remember what COM port it comes up as.

On the first line of the script, you might change it to:

#!/usr/bin/perl -T

to secure it a little bit.

27566. Re: [FT897] MMB-80 car mounting bracket

Yahoo group: FT897 (2009)
Date: 2009-08-28 12:08:52 UTC
From: DavidN
Topic: 27561 Message: 27566

Hi Bret. I have the MMB80 and it's a solid item. As you say you could replace the screws with thumb screws and then all you'd need to do to remove the radio is undo the four screws a turn or two and the radio will then slide out of the MMB80. Of course disconnect the ae. and power, so a total of about 20-30 seconds.

It has a number of slits on the top or bottom of the MMB80 (that's depending which way you mount it), so it's very versatile to where you put the screws to mount onto or under your dashboard... or facing upwards. I have mine under the dash and was able to easily fine tune the position by having the screws slightly undone, move it for best position (space was very tight)then do the screws up finally. I am now very happy with it's position, nothing rattles on it and the whole think feels very solid.

Also there are three slots on the MMB80 at each side so you can angle the radio to suit. All very adaptable.

Hope this helps.

David G4TUP.

If you're patient you can find a great deal like the one I got...
* FT-897D transceiver unit
* One LDG AT-897 Autotuner
* One FP-30 Power Supply
* Two FNB-78 NI-MH batteries
* One CD-24 Battery Charger
* One PA-26B AC adapter
* One YF-122C Collins CW Filter
* One YF-122S Collins SSB Filter
* One MH-31 Microphone
* All included paperwork
* Various Cables (power, 3.5mm Jack)

All brand new, sealed in the boxes... I paid $1100.00.
online price was $1959.56 @ hamcity.com, I have the invoice.
Just remember, if you don't buy it from a Yaesu Dealer, There is no warranty and the warranty is worth something. But you can get a 4 year warranty from SquareTrade.com for about $100.

Do your homework and know your "new" prices as well as used. Say no to retail pricing on eBay or anywhere else.

27569. FT-897D for sale

Yahoo group: FT897 (2009)
Date: 2009-08-28 20:13:39 UTC
From: piotr_sniezek
Topic: 25792 Message: 27569

Hello,

I have for sale my Yaesu FT-897D in immaculate condition. Only one year old, in perfect working order, never been used outside the shack, never been opened, modified or abused. It has absolutely no marks or scratches. Looks and works like new.

It comes in original box with MH-31 microphone, power leads, and manual. Location of the item: London, UK. Price £439 + p&p (within mainland UK it's £21 next day, insured). Test and collection welcome. Cash on collection or Paypal accepted.

Please visit: www.m6ctu.com/ft897.html or email: m0tcx@... for details.

27570. Cleaning out a dusty radio

Yahoo group: FT897 (2009)
Date: 2009-08-28 23:41:04 UTC
From: John Geiger
Topic: 27570 Message: 27570

I just got a used Yaesu FT857D today and it is rather dusty inside-it definitely looks used. Cleaning the case and the front wasn't too tough, but what is the best way to clean out the insides of a radio? I thought about the vacuum cleaner, but don't want anything that might cause static electricity to the components. It does seem to work ok as is.

73s John AA5JG

27571. FS: Yaesu FP-1023 power supply

Yahoo group: FT897 (2009)
Date: 2009-08-29 02:14:04 UTC
From: John Geiger
Topic: 27571 Message: 27571

I have for sale a Yaesu FP1023 switching PS which does 23 amps at 13.8 volts. It is the matching power supply for the FT857 and FT897. It is small, compact, and lightweight, and has 5 way binding posts on the back. Also comes with the power cord to plug into the wall. You can read more about it here:

http://www.universal-radio.com/catalog/hamps/3631.html

It has a few scratches on the case but works just fine and looks ok overall.

It sells new for $170 plus shipping. I am asking $85 shipped, and can take paypal/check/MO.

I would recommend getting a can of compressed "air" from a computer
supply store. They are designed specifically to clean out dusty
computers and such and only run a couple of dollars/euros/pounds (or
less).

You can remove the covers and use a can of compressed air, such as one that you would clean your keyboard with, and blow out any dust.

I just got a used Yaesu FT857D today and it is rather dusty inside-it definitely looks used. Cleaning the case and the front wasn't too tough, but what is the best way to clean out the insides of a radio? I thought about the vacuum cleaner, but don't want anything that might cause static electricity to the components. It does seem to work ok as is.

John -

Despite the fact that many advise the use of compressed air from cans or otherwise, I try NOT to use this method. Compressed air will tend to pack dust into areas where you might not want to have the dust. Some compressed air products may also have or leave an unseen amount of moisture on the area being "cleaned."

The use of a vacuum with a proper wand would be my preference. A static charge from the wand is unlikely.

The use of soft brush to carefully brush the boards and parts to loosen the dust before and during the use of the vacuum should be considered.

If you want to get fancy...Shop-Vac makes a 1.25" (32mm) Micro Cleaning Kit. I've using this for years.

Happy house cleaning es 73,

27576. Basic Issues with my FT 897D,, Can someone talk me thru them..

Yahoo group: FT897 (2009)
Date: 2009-08-29 16:23:02 UTC
From: papadelta12001
Topic: 27576 Message: 27576

Hello Group.

I have owned 3 FT 897D's.. 2 new ones.. and now one very clean used FT 897D.

I purchased a new 897D about a year ago, I was just divorced and living in a studio apartment. No room for my Ten Tec Paragon so I sold it for the 897D.. I was trying to use a indoor 20 meter dipole. NO way to get a outside antenna in a apartment. THE radio was having fits.. HI VSWR displays and fold back of pwr on 20 meters with a well build 20 meter dipole. My friend had the same issue.,. He to was divorced and no room for a radio,., and dipole just outside his apartment. I build him a dipole from 22 ga wire and we tucked it under the balcony of the guy above him.. He to had HI VSWR display..

That went away with a MFJ 969 tuner.. and tuning the 20 mtr dipole for use on 20 mtrs..

I went toe to toe with YAESU on my issues and his.. And they just refunded my money.. After sending me another and I had the same issue.. I didn't have a tuner at that time.. Alot of my stuff was lost in the divorce.. I thought that a radio should work on 20 mtrs with a 20 mtr antenna.. In the 897 manual they show a man on a park table with the vertical antenna on the corner of the table.

I am 5 blocks from the south shore of Long Island. Taking the radio to the beach was something I wanted to do.

I retired ham gave me a vintage Drake rig.. And I had NO room for it.

SO I traded for another FT 897D THE guy that owned the 897 told me it did only 40 watts.. And it does.. into a dummy load inside my MFJ 969 tuner.. I get NO HI VSWR displays.. The power will fold back.. BUT only 40 watts when you have a good match thru the 969 tuner.. OR dummy load..

The pwr is set for HIGH,, and I did a reset.. STILL have the issue

And YES I am using a IN DOOR 2o mtr dipole. I can make contacts with 40 watts,, BUT 100 would be nice.

The other issue is a loose tuning knob.. it comes OUT.. shaft and all..

I wonder if there is anyone on Long Island that would like a cup of coffee to help me with this.. OR maybe someone on the phone.

With my experence with YAESU CALIF.. I am not sure if I want to ship this back. Unless I have to and Have done it all try to fix the issues..

Thank you..

Please respond to my main e-mail..

27577. FT-8xx cross platform perl module for CAT programs

Yahoo group: FT897 (2009)
Date: 2009-08-29 17:54:25 UTC
From: Trixter aka Bret McDanel
Topic: 27577 Message: 27577

I wrote a perl module that extends Win32::SerialPort or
Device::SerialPort depending on what platform you run it on. This means
that it should work in Windows, Linux, BSD, OSX, Solaris and probably
elsewhere.

The idea is to be able to let people quickly develop cross platform
tools without having to know anything about serial ports, the CAT
protocol, or any of that. Fortunately, since I dont know much about it,
and got really lucky by closing my eyes and randomly pressing the keys
on the keyboard.

This provides every documented CAT command in the FT-897 manual. I will
be adding undocumented commands in the near future. I will also be
looking at ways to read values out of the EEPROM to give you information
that is not available any other way.

To download the module, or for more information visit
http://www.0xdecafbad.com/?p=188

Responses about this should probably be offlist.

27578. Re: [FT897] Cleaning out a dusty radio

Yahoo group: FT897 (2009)
Date: 2009-08-29 18:52:15 UTC
From: Randy Charles Ford
Topic: 27570 Message: 27578

Since I'm wanting to remove dust, I prefer a vacuum to a stream of gas into the unit. The static problem is due to the velocity of the air, whether it is blowing or sucking. I drilled holes in the side of an extension pipe for my vacuum to reduce the suction from the working end. I cover holes as needed to adjust the suction for different tasks.

If you don't have an extra extension laying around, you may be able to find one at a thrift store: they seem to be made in standard sizes. Besides, isn't homebrewing a solution what being a ham is all about <grin>. Maybe I should add a valve, gauge, and grounding sleeve and submit an article to QST. <I try to be careful when putting my tongue this far into my cheek so that I don't bite it.>

73,
kg4jix - randy.

27579. FT-897D and PSK31

Yahoo group: FT897 (2009)
Date: 2009-08-29 20:28:55 UTC
From: Noel Zeibari
Topic: 27579 Message: 27579

Hi all,

I am new to FT897D, today I set it up to work the digital mode PSK31, using
the SignaLink USB interface and MixW
Here is the lineup:
Band mode= Digital
Band= 14.070.00
Power= 30 watts
Digital Mode= PSK31 USB Menu # 38
Digital Mode= RTTY USB Menu # 38
Digital Shift= Default 0 Hz Menu #39

Whenever I transmit the frequency shifts down to 14.069.60
What am I doing wrong here? Any ideas on how to setup the menus for PSK & RTTY?

On my Kenwood TS450S/AT, just park it on 14.070 and USB work PSK and RTTY AFSK.

Would appreciate your help.

From: edmetzler
Topic: 27580 Message: 27580

This is the first time trying to send cw using the 897D. I have it set to use the built-in keyer, and I'm in CW mode and in the 20 meter band, but when I send, all I get is side tone; it's not transmitting. I've gone through the section on CW in the manual, and it looks like I have everything set correctly. Any ideas?

I've successfully used my 897d with psk31 and haven't seen the same problem you're seeing.
I've just set the mode to DIG and it's worked fine.
I haven't messed with any other menu settings so mine are set to the factory defaults.
I'm using the rigblaster plug and play with the cat plug that plugs into the rigblaster. So my rigblaster has plugs going into both the data and cat ports.
It looks like the menu items you've mentioned are set correctly. I'm thinking there's another setting I'm unfamiliar with that's causing the freq shift on transmit.

I can't remember what page it's on, but there's a soft-key labelled "BK". When it has brackets around it, CW is enabled. When there are no brackets, you'll only get sidetone.

When using the Signalink, you don't need to set digital mode. The
radio will accept audio from the DATA port whenever the data PTT line
is keyed.
Set the radio to USB
turn OFF cw-auto mode
and make sure split is turned off (it's SPL in the soft-menu at the
bottom of the screen).

Thanks to all who responded to solve my problem. Almost all of you mentioned to use USB mode.
In USB mode, when pushing Fx key it was transmitting
with a high pitched squeal and the freq. would shift down to
14.069.60.
The manual mentioned to use digital mode, that also shifted the Freq. down.
Here is the solution:
Tom KI6ABZ suggested to turn the CW-auto mode to OFF and make sure the split (SPL) is not active. That solved part of the problem, I am able to key with USB or digital with no squealing, but the shift down persisted.

Then my cousin Peter EIGHT, mentioned to check the RITA. Well, there it was, the big problem. Some how in my getting acquainted with the rig, pushed the lock button on the RIT when it was set to a minus setting.

Now, the RIT is set to Zero and Locked. Now I can work PSK with USB or
Digital mode dead on Frequency.

Thanks a million guys. At my age I am sure will back for other minor questions, in the mean time the manual is always next to me like a Bible when operating.

Hi all.

Does anyone have any recommendations on how to setup / get the most out of the DSP function?

I seem to leave it switched off most of the time as I seem to lose the voice when I switch it on making it a pointless option on the radio. Now Yaesu or anyone else would spend time and money on making a pointless option so I must not be using it to the best of it ability.

Kind regards

Scot

M1AFY

Since you said voice that limits this to AM/FM/SSB, I will leave my comments for those modes only.

Depending on which options you have enabled you may be able to tweak it to filter unwanted noise from the desired noise. There are pass filter options, page 59 of the manual states that the default option is 6000Hz for the low pass, and a tip that best results for voice would be obtained between 2130 and 2770Hz. This is menu item 47.

Menu item 46 is the HPF and it defaults to 100Hz, and the tip is not to set it much above 400Hz.

Telephones are generally 300-3600Hz because that is where most human voice is in. Depending on exactly who you talk to, what the conditions are, and the operating mode you may need to adjust that a bit.

Menu item 49 sets the DSP noise reduction level, it defaults to 8 but its range is 1-16, so you can adjust that a bit and maybe get some benefit out of it.

I would start with those options, although there are a couple more options for the DSP, those will probably be the most useful initially to adjust.

Doesn't DSP stand for Digital SPEECH (as in VOICE?) processor? It would, therefore, really have no affect on digital modes such as CW, PSK, Paket, etc., is this correct?

it was my understanding that its digital signals processing, since you can use DSPs to process modem, fax, and other non-voice modes of communication.

The DSP in the FT-897 can help clean up CW signals as well, and there are options for that specifically on page 59 in the manual. I left those modes out specifically since there was the voice comment.

Basically it depends on what its doing exactly, and how its doing it as to whether or not a DSP would be beneficial to any given mode of communication.

WSPR is open source software that uses DSP algorithms to pick out data signals below the noise floor, to further illustrate that it is more than just voice that can be processed by this rather wide range of algorithms (whether they are in dedicated hardware or done via software is to a point moot, granted dedicated hardware is usually more efficient at it).

It stands for digital signal processing, and the DSP bandpass filter (which is more like a peak filter) makes a huge difference on CW, really bringing signals up out of the noise and cutting out some QRM. In my opinion it is the best function that the DSP does on the 857/897/100 and puts if miles ahead of the DSP on the Icom 706 series.

27598. Output to low on all bands

Yahoo group: FT897 (2009)
Date: 2009-08-30 22:57:52 UTC
From: oz1bv
Topic: 27598 Message: 27598

Hi

Got a strange problem with my FT-897:
The TX power is too low on all bands (including 2m & 70cm).
The max. TX power on HF is about 25 Watts, on 6m 45W on 2m 30W (70cm I have not measured).
The TX power is variable on HF/6m, from 5W. On 2m the lowest power is 25W.
The audio sounds good, and the idle current on Pre-driver, driver, exciter and PA is as the service manual says.
On 2m the HIGH SWR warning is flashing when TX into my dummy load (SWR is 1:1). The radios own SWR indicator also indicates no return power.
On HF / 6m the HIGH SWR is not flashing when TX'ing into a dummy load.
I have measured the diodes in the SWR bridges and the diodes which joins the FWD and REW signals from the HF/6m PA and the 2m/70cm PA, all diodes are okay. The SWR voltages measures on J3002 also seems to be okay.

Does anybody have any idéeas about where to look for a broken component?

Best 73 de OZ1BV, Brian

Topic: 27598 Message: 27599

Are you using a continuous carrier mode, such as FM or AM, when testing power?
If not, how are you doing it?

Is your dummy load specified for 2m? Most are not.

Was it working at higher power, then suddenly dropped?

When you say "the TX power is variable on HF/6m," do you mean that it varies
by frequency, or over time on one frequency?

What do you mean about "the lowest power" on 2m? What is the highest power,
and when does it change?

73,
kg4jix - randy.

Hi Randy

I have inserted comments in the text below:

--- In FT897@yahoogroups.com, Randy Charles Ford <kg4jix@...> wrote:
>
> Are you using a continuous carrier mode, such as FM or AM, when testing power?
I have testet in these modes: CW, FM and SSB (With a constant tone). Outputs are the same.
> If not, how are you doing it?
>
> Is your dummy load specified for 2m? Most are not.
>
My dummy load is specified to 650 MHz (MFJ-264 dry dummy load).
I have messured the SWR with a SWR-meter to make sure that the dummy load (and cables) are okay. The internal swr meter in the radio also says low SWR.

> Was it working at higher power, then suddenly dropped?
>
I don't know. I overtook the radio with this problem.

> When you say "the TX power is variable on HF/6m," do you mean that it varies
> by frequency, or over time on one frequency?
>
It means that I have, in menu 075 adjusted the TX power between minumum and maximum.
I have just measured the TX-power and this is the exact result:

Band: Min - Max TX power)
160m: 5 - 20W
80m: 10 - 18W
40m: 12 - 18W
30m: 10 - 35W
20m: 15 - 40W
17m: 11 - 25W
15m: 12 - 19W
12m: 11 - 15W
10m: 11 - 20W
6m: 12 - 50W
2m: 30 - 35W (High SWR is flashing)
70cm: 0,4W - 0,5W (High SWR is flashing)

Just to be sure about the results on 2m and 70cm I did connect another cable, another SWR meter and my antennna (which has SWR below 1-1:2) and the TX power is the same plus the High SWR warning is flashing.

> What do you mean about "the lowest power" on 2m? What is the highest power,
> and when does it change?
>

Hope I have covered this in the above.

27602. User comments on new LDG YT-100 tuner?

Yahoo group: FT897 (2009)
Date: 2009-08-31 17:09:15 UTC
From: thb201
Topic: 27602 Message: 27602

Hello group:

I notice that LDG has come out with the YT-100, a new dedicated tuner for the FT-897 (also for the FT-857 and FT-100). This tuner looks interesting. Is it an upgrade to the AT-897? As far as I can tell from reading the manuals the AT-897 does not reduce power on the rig for tuning. It just switches the rig to CW and starts a tune cycle. The YT-100 appears to reduce power, switch to AM, and then start a tune cycle. Also the YT-100 has 2000 memories over the AT-897's 200 memories. In addition the AT-897 shows two cable needed (ACC and CAT) while the YT-100 shows only one cable needed (CAT).

On eham.net there are only 3 reviews so far (all 5.0's) as the YT-100 is so new. I have no experience with LDG tuners and I was wondering if anyone on the list has this tuner and can comment on it above and beyond what is on the eham site.

Thanks in advance.

27603. OT: antenna impedance algorithm

Yahoo group: FT897 (2009)
Date: 2009-08-31 18:12:11 UTC
From: Trixter aka Bret McDanel
Topic: 27603 Message: 27603

I am desperately seeking anyone that knows the algorithm, its name, or anything that would help me locate it for the RF impedance when you have two tubes, one inside the other. For example if you make an antenna using metal tubing, the diameter of each of the two tubes is important for matching.

I cant find this anywhere and am asking everyone that I can think of that might know it. I saw the algorithm in passing 10-15 years ago and cannot recall much other than diameter of the two tubes (inner diameter of the outer tube, outer diameter of the inner tube) was used to calculate RF impedance.

Any help would be greatly appreciated, the source that contained this info is no longer online.

Thanks,
kc2dwq

27608. Re: [FT897] OT: antenna impedance algorithm

Yahoo group: FT897 (2009)
Date: 2009-08-31 21:25:48 UTC
From: Chris Baker
Topic: 27603 Message: 27608

assuming its circular,
try Z=138 log(base10) x Large Dia of tube/small dia of tube
This applies when the meduim is Air
If using a dielectric, the value of Z should be multiplied by 1/ square root of the dielectric constant.
(Ref RSGB Radio Data book page 141)

Thanks

I am desperately seeking anyone that knows the algorithm, its name, or anything that would help me locate it for the RF impedance when you have two tubes, one inside the other. For example if you make an antenna using metal tubing, the diameter of each of the two tubes is important for matching.

I cant find this anywhere and am asking everyone that I can think of that might know it. I saw the algorithm in passing 10-15 years ago and cannot recall much other than diameter of the two tubes (inner diameter of the outer tube, outer diameter of the inner tube) was used to calculate RF impedance.

Any help would be greatly appreciated, the source that contained this info is no longer online.

Thanks,
kc2dwq

27609. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-09-01 07:20:36 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 27609

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB

27610. Re: CAT System on the MIC socket for Yaesu FT-897/857 (HIDDEN CAT COMMANDS???)

Yahoo group: FT897 (2009)
Date: 2009-09-01 15:02:48 UTC
From: john_kb0ne
Topic: 27528 Message: 27610

Hi,
I have noticed that HRD will momentarily mute the audio when changing frequencies (this is a normal thing when updating frequencies via the CAT port)... BUT when using the mic (or main tuning knob) to change frequencies the momentary mute does not happen.

I'm wondering if there are hidden or unpublished CAT commands for the 897D that allow the hand mic to operate in a mode similar to the main tuning knob.... If so it might be worthwhile to pass along this tidbit to Simon at HRD so the 897 CAT commands can be updated to give better scanning performance.

27611. Finals and Antenna Switches!!

Yahoo group: FT897 (2009)
Date: 2009-09-01 15:35:04 UTC
From: for_rowdy
Topic: 27611 Message: 27611

Late last night I was listening about on my Kenwood 850 and then switched back to my FT-897D and forgot to move the appropriate antenna switch. The LDG Z-11Pro attempted to tune (no antenna) after I pushed the tune button several times, of course to no avail. Without thinking I pushed the press to talk peddle for a couple of seconds too.

Is that enough to do serious damage to the finals? If finals are damaged do they exhibit less output or do they simply blow out? Was able to check in to a net this morning with a 57 signal report.

I guess I need red stickies with warning messages to put on the front of my rigs so I remember to switches those switches!!

You do not mention if the radio(s) are no longer functioning correctly. That said, if you haven't tried to use the radio(s), go ahead and do so. All should work ok and be just fine, but the only way to tell is to attempt to use the radio(s) and verify if there are any problems.

the 879 will scale power back if you have a high swr. This is automatic
and afaik there is no way to disable this feature (which is probably a
good thing).

I would not do this all day and rely on that but it should help to
protect the rig from short duration accidents like this.

I did put in an email to yaesu on your behalf to see what they have to
say (plus I want to know the answer just in case :) I did not identify
you in any way. If they read this email, they would have already read
your original post, so I dont see that as a concern. The person that I
contact at Yaesu generally gets back to me fairly quickly so I should be
able give you their answer later today.

He said he got a 57 signal report, although I dont know if that is
normal or not, it apparently does transmit, and that could be an
indication that it transmits as normal.

Hi Dennis
Thanks for the reply. The radio seems to work fine, although my question stems from the fact that the Aux. LDG accessory meter doesn't seem to show Pwr very well. Maybe it never has - I don't know. And the Pwr. meter on the radio I find virtually impossible to read with any accuracy.

It was the low power that prompted me to think I might have done something to the finals, but your reply is reassuring.

Perhaps :)

>From Yaesu support:
"The FT-897 will scale power back to protect the finals from a high SWR.
A short TX without an antenna will not normally destroy the finals, but
that does not mean that could not."

I used the phrase 'damage' in my question, his response 'destroy'
implies a catastrophic failure, which obviously you do not have with the
signal report that you got.

Hello Mike:
Did you test this noise reduction with a solar panel or with the wall charger? Anyway, this looks promising. Can you post the cd-24 schematic to the files section? I would like to start work on my cd-24 so that I can use it in the field using a solar panel. Thanks for the update.

From: John Geiger
Topic: 27620 Message: 27620

I am looking for a CW filter for my Yaesu FT857D. I would prefer the 300hz filter, which is INRAD #712, Yaesu YF-122CN or W4RT OPF-Y-CW-300 models, but would also take the 500hz filter-INRAD #712 or Yaesu YF-122C.

Anyone have one for sale? I can pay with paypal, check, or MO.

Hi Rob,

The SWR protection circuit should protect the finals in the case of a bad antenna SWR or no antenna. Does the RF output meter on the FT897D show that you are still putting out full power?

Topic: 27602 Message: 27624

I am one of the early eham reviewers, but now have a couple more months' of experience with the YT-100. I have so far been impressed with its operations; it tunes fairly quickly, remembers where its been, and certainly could not be more simple to use (one button). I have used it extensively on 20M, 40M, and 80M with no problems. I have less experience on other bands, but it seems to tune everything I have tried (I run a G5RV Lite antenna - the one with traps).

It does not attach to the FT-897; it is a stand alone unit.

>
> I notice that LDG has come out with the YT-100, a new dedicated tuner for the FT-897 (also for the FT-857 and FT-100). This tuner looks interesting. Is it an upgrade to the AT-897? As far as I can tell from reading the manuals the AT-897 does not reduce power on the rig for tuning. It just switches the rig to CW and starts a tune cycle. The YT-100 appears to reduce power, switch to AM, and then start a tune cycle. Also the YT-100 has 2000 memories over the AT-897's 200 memories. In addition the AT-897 shows two cable needed (ACC and CAT) while the YT-100 shows only one cable needed (CAT).
>
> On eham.net there are only 3 reviews so far (all 5.0's) as the YT-100 is so new. I have no experience with LDG tuners and I was wondering if anyone on the list has this tuner and can comment on it above and beyond what is on the eham site.

No it does not. The AT-897 is made to mount right against the left side of the FT-897 and the rubber legs in turn go on the tuner for setting the rig down when portable. I use the AT-897 on base and do not have it mounted to the rig and it works excellently.
The YT-100 is similar to the AT-100 except for some improvements, like memories. You can't get the outdated AT-100 except at some dealers who may have a few left NOS. It will not mount on the side of the FT-897 as it is a "external" tuner. The comtrol wire is a little short, but it certainly does the job.
Both tuners work very well, have a small foot print and are very quick to tune.

It looks like it's the same size as my Z-11, which is a pretty small package. I used 2 pieces of double-sided mounting tape to attach my tuner to the top of the radio; it's pretty secure there, even when I take the radio for a trip.

27629. Transmitting problem on the Yaesu 897D and RT Systems Software

Yahoo group: FT897 (2009)
Date: 2009-09-03 01:45:52 UTC
From: d_marotti
Topic: 27629 Message: 27629

I have the strangest problem. I have RT Systems software that I purchased from RT Systems directly along with a cable to connect to my Yaesu 897D radio. When I synch (send) to the 897D, all my memories and settings transfer over to the 897D flawlessly, and everything seems great. When I say great, it is actually not perfect. Each time I synch, I still have to turn SPL ☐ (split tones) off - {represented as "TEN" pp 13 of the manual} in order to get the radio to transmit. However even after turning off [SPL], once I shut off the radio, when I turn it back on, all of my memory settings are still there, and the other radio settings, however the radio itself will not transmit, and [SPL] is still off. The only way I can get it to transmit again is to reconnect the cable and resend the data from my laptop again, and then to turn off [SPL] again. Then everything works perfectly , that is until I turn off the radio again. Does anyone know what I can do to stop this? It is making me crazy. So to sum it up, I have to re-synch each time I want to use the radio, and then turn off [SPL]. Please advise. Thank you.

Try setting up the rig how you want it, with all menu items, frequencies and repeaters also set where you want them. Then, READ the radio first (you may need to save it separately from the other "saved programming"), Clear out the radio (master reset) then make frequency changes, repeater changes, menu changes, in the computer software, then SEND back to the radio. That "should" clear any problems get the rig back where it should be. It seems like there is a problem with the internal memory with "both" settings being saved and the rig not knowing which it should follow. This should get the rig right.

27633. FT-897 and telephony software interconnect

Yahoo group: FT897 (2009)
Date: 2009-09-04 01:05:05 UTC
From: Trixter aka Bret McDanel
Topic: 27633 Message: 27633

I have finished the _initial_ version of my perl script that interconnects with FreeSWITCH.org an open source telephony platform to allow the FT-897 to be bridged into FreeSWITCH. I will be providing full instructions as well as the scripts free on my blog in the next day or two.

I have only tested this with an FT-897, although this should work with any radio that has a remote PTT, speaker jack and mic jack that can be connected to a computers sound card. The interface circuit is known to work on a VX6 as well as many other radios, and only costs about $5-10 to make.

What I am requesting is that anyone who is interested in this to email me off list with what minimum features you would like to see in the initial version so that they can be added.

The initial vision that I have is to make a toolkit to allow people to cheaply and quickly build a repeater (with some technical limitations), create a radio->phone bridge (autopatch, with or without a repeater), etc. I will however entertain any reasonable suggestion for a feature.

About FreeSWITCH. FreeSWITCH is a cross platform telephony application licensed under the Mozilla Public License (MPL). It runs natively on Windows, OSX, Linux, Solaris, BSD and others. It gives you the ability to interconnect traditional phone lines, isdn circuits, VoIP accounts, and if equipped and licensed even work as a GSM tower (BTS). It can provide a common platform for disaster communications allowing multiple different technologies to all talk to each other. It is free and open source. More information can be obtained at http://www.FreeSWITCH.org

Hi, all.

I've just got a Yaesu CAT cable for my FT-897. Using Ham Radio Deluxe, the software finds the radio OK and takes control. But I'm getting a noise on the audio which swamps the signals (from satellites, so fairly weak). It sounds like it's chopping the audio about twice a second. When I untick the RX box on the Satellite page of HRD, the noise goes away.

Any ideas, anyone?

It could be that there is noise going through the serial ground to the radio. If you disconnect the serial port after tuning does the noise go away?

If so then you may have a bad cable (I have not experienced that with my CAT cable). I cannot understand how HRD itself could be causing this (knowing how it does what it does). I think it would be the CAT cable.

If I were to take a wild guess, I would say that your computer power supply (or perhaps something else) is generating the noise which is carried to your radio, possibly via the ground connection in the serial port.

It's a function of baud rate as HRD polls the radio.
You won't hear the noise if you have set the 897 and HRD to 9600 baud or less.

27640. FT-897 data out connector

Yahoo group: FT897 (2009)
Date: 2009-09-05 12:14:56 UTC
From: oziemike
Topic: 27640 Message: 27640

Is anybody familiar with the audio output from the data socket on the rear. I use an FT-897 as an IRLP node radio. As we run CTCSS it seems that rear data socket is unfiltered audio out(obviously for use in the data mode).

Does anybody know if both the 1200 & 9600 outputs are unfiltered? I need to try and strip the CTCSS before it heads off into the node.

Mike

9600 is not filtered, I made a $10 circuit for this if anyone is
interested. http://www.0xdecafbad.com/?p=144 schematics and pin
numbers are listed. I am writing echolink node software for freeswitch
now and will be starting on irlp soon after. This will use that
circuit, which is a fairly standard serial connection.

27642. FT-897 for sale with acc

Yahoo group: FT897 (2009)
Date: 2009-09-05 21:38:53 UTC
From: tenorman1952
Topic: 27642 Message: 27642

I've got a nice FT-897 (not the D) for sale, with LDG AT-897 installed, FP-30b power supply (the newer no noise one) installed, and a few asst cables/jumpers. Also a power cable Molex 6 pin to Anderson Power Poles for battery operation. Everything works.

ALSO installed, BHI Inc 1061 DSP module. The button for the DSP is intalled in place of the A/B battery rocker switch. I never intended to use the internal battery feature. This DSP is very much superior to the one in the 897. I'll throw in an external speaker, too,

Two MH-31 mics.

I do not have the original box, but do have the manual. I have a pdf manual for the LDG tuner, and will put that on CD along with pdf manuals for the FT-897. Have the manual for the BHI DSP.

Asking $750 which includes shipping within the US lower 48.

Hi Craig,

Any chance that the passband tuning function is enabled, indicated by upward or downward arrows on the right side of the frequency display? If so, it can certainly give you the symptom you are describing and can be altered by turning the clarifier knob. If PBT is not enabled then it's possible that the service menu setting for LSB-CAR-POINT is not correctly adjusted. If that is the case, I would urge you not to adjust it without first backing up all of your rig's unique service menu settings and examining page 20 (Carrier Point Adjustment) of the service manual.

No, everytthing is set to default. Actually this radio was recently gone over by Yaesu for the, somewhat popular, filter issue.

This may a normal thing for this radio. I have never had it on SSB until recently. I did do a reset but no diference. The only thing that makes it even close to listenable, on LSB, is setting menu option 015 (CAR LSB R) to +250 or so Hz.

Thanks for the reply,

Craig

Hi Craig,

I think what you are seeing is not all that unusual for this radio, but it is not normal. My own 897D exhibited the same behavior you are describing with the factory service menu settings. It was most easily illustrated by listening to an empty frequency and then switching from USB to LSB to observe that the background noise sounded very different. One sideband exhibited a very high pitched response while the other sounded much fuller. When adjusted correctly, USB and LSB should sound exactly the same. The problem was easily corrected by correctly aligning the carrier set point (067 and 068 in the hidden service menu) for each sideband as described in the service manual. Note that doing a reset does not correct those values. You can compensate on receive by using the 015/017 carrier offset settings in the user menu, but keep in mind that if the service menu settings are incorrect, your transmit carrier insertion point is also off. Unfortunately, through the years a fair number of these rigs rolled off the assembly line with less than optimal service menu settings.

Good info!

Here are the OEM Settings:

067 = -25 (LSB)
068 = -15 (USB)

<CHANGED TO>

067 = +15 (LSB)
068 = -15 (USB)

Now when switching between USB and LSB there is a little if any difference.
Since USB sounded fine, I figured I'd try the oposite for LSB. Seems logical anyway.

I'd be interested in know what the ->correct<- settings or normal settings, if there is such a thing, should be.

Thanks for the help!

Now, tell me if did bad?

If one of the sidebands seemed to be fine, and you "equalized" the one that seemed off to behave like the other sideband, then you did what most people do and it should be fine. Each radio has its own unique settings for each of the 74 items, but your question is one that is often asked. Several years ago, Jochen, DG2IAQ collected service menu settings from 16 users, and the average setting based upon their data was:

067 = -7 (LSB)
068 = +3 (USB)

The actual OEM data for 067 ranged from -3 to -23. For what it's worth, your setting of -25 is outside the range of all the collected data on Jochen's spreadsheet. Again, this means nothing since each rig is unique, but it supports what you were hearing and that your rig's 067 alignment was probably out of whack.

My OEM settings were:

067 = -8 (LSB)
068 = +3 (USB)

In my case, it was necessary to change 067 to a value of +14 to place the LSB insertion point into the correct area of the passband, which is very similar to where you ended up.

You should be on the mark now!

Rob, many thanks for the help! Perhaps this will too will help someone else. Operating CW, these things rarely are noticed. I just took a notion to listen to 75M one night and there it was. Who knows, it may have been right out of the box and something got changed when Yaesu repaired the radio. (excellent repair turnaround BTW, shipped on a Monday 3-day Select and received it back the following Monday!)

Thanks for all your help. I'll try to help someone else in return.

Have a good Labor (Labour) day and best 73

Very glad to help Craig, and I'm glad you were able to set it to your satisfaction. The service menu settings in the 857/897 series of rigs appear in some installations to be susceptible to corruption from such things as RF feedback, power supply transients, and static discharges. It is very advisable to make a complete record of the 74 service menu factory settings to allow a new user to return their rig to those values should disaster happen. Unfortunately, those factory settings can be somewhat "off" right out of the box! Your rig and mine probably fell into that category. At any rate, when properly adjusted, these rigs give a lot of bang for the buck.

Have a nice Labor Day!

27654. MH59 Mic Question

Yahoo group: FT897 (2009)
Date: 2009-09-07 19:38:40 UTC
From: rrkpl
Topic: 27654 Message: 27654

Some years ago I had a FT-897D with a MH59 Mic. Though I loved the remote functions when I operated portable with a less than ideal antenna the mic was VERY susceptible to RF making it kind of useless. I called Yaesu at that time and they admitted that was a problem with the MH59.

I just recently acquired a 897D and was wondering if there was any improvement in RF susceptibility in the MH59 over the years that would warrant buying it.

Thanks,

Richard / W4RRR

I have a similar setup, and have not noticed any problems, although I do not have a bad antenna. The worst antenna that I have is a bit of wire with a Z11pro tuner. I have not noticed anything even at higher Tx levels.

What frequencies was it most problematic at? I can run some tests and see if the current equipment has similar problems. The more information that you can provide on what the problem is and when it occurs the more I would be able to test it.

My radio is October 2008, and my mic appears to be the same assuming they use the same coding for its manufacture date in the serial number.

Thanks for the reply. The problems I experienced with the mic were usually at frequencies where the tuner had to work for a match with an non-resonant antenna. I used a SGC 211 tuner and a loop (tuner at antenna with coax feed) put up in nearby branches ... and lower frequencies tended to cause RF feedback in SSB audio that would be eliminated by replacing with the stock MH-31 mic. QRP to 20 Watts mostly ok but 75-100 watts it showed up most.

Thanks,

Richard / W4RRR

I will try to replicate this at some point, probably later today. I
have yet to find a place my tuner has to work hard to find a match
though so I may not be the best candidate.

27658. Battery LEDs light faint red

Yahoo group: FT897 (2009)
Date: 2009-09-08 12:53:56 UTC
From: scot@scotjones.co.uk
Topic: 27658 Message: 27658

Hi All

I've noticed an issue on my FT897 in that when I transmit on 6M the battery leds glow dimly in red.

Could this be a sympton of RF back into the radio? the reason I ask is that ive installed a new 6m antenna and ive only noticed it since then (oh and the nights are darker here now aswell is also highlighting it)

SWR at the radio is fine as its connected via an ATU and at the antenna its only a bout 1.2 anyway.

Any help appreciated.

de M1AFY

If the SWR is only 1.2:1 I'd try connecting the ae. direct to the set to see if the problem goes away. Also, do you have a thick earth strap connected to the earth point on the back of the set?

I run 6m mobile with a 5/8 wave mag mount and the SWR is 1.2:1 also with no problem. With or without the earth strap to the car (I used UR67 braid, flattened) my battery lights do not glow - no batteries installed BTW.

27660. japanese manual

Yahoo group: FT897 (2009)
Date: 2009-09-09 01:50:08 UTC
From: Trixter aka Bret McDanel
Topic: 27660 Message: 27660

I am looking for a japanese pdf manual for the 897, or at least an image from it that shows the character set. I was playing around today mapping out a bit more memory on my radio, and I discovered that the kanji character set is there, although its undocumented and not directly available from the regular menus.

Basically if you wanted to have memory tags with kanji on the US variant you can, although you have to directly write to the memory instead of indirectly writing to it via the menu controls. I wanted to list these, but I dont have images handy of the different characters.

So if someone could provide me with a screenshot of the pdf opened to that page (100% zoom please) or the pdf manual I would appreciate it. I checked the files section and there does not seem to be a japanese manual uploaded yet.

Thanks,

kc2dwq

From: kc9aop
Topic: 27661 Message: 27661

Hi everyone,

I've had my radio for just a few weeks now. Yesterday I went to use it and found that nothing happened when I keyed the MD100 mic. Of course I was not pleased and tried to use the tuning ring on the mic and the lock and the switch on the mic handle itself and nothing seemed to work.

I plugged the MH59 in and the radio worked just fine. I then tried the MD100 and it worked too... I'm now confused but the radio seems to be fine.

Is there something with the radio or the mic that I don't understand???
Any thoughts?

Is there a setting in the menu for which mic you are using. I know there is a menu item for it but do not know if the MD100 is in that list. Check it and let us know.

Hello Jim

I see you have found the biggest fault associated with the FT897 series of radio... The modular mike plug.... it seems to have a mind of its own.

I also discovered this fault some time after fitting the MD100, desk mike.

When I switched back to the fist mike,,, all was OK,,, like you I tried the MD100 again later,,, and found that the fault seems to be the socket which is part of the front panel of the radio.

It is a complete nuisance as even if you are using the lock facility on the MD100,,, the slightest wind or hand movement will disconnect, your PTT, and the other person in QSO with you will be heard coming back,,,, as he thinks you have finished your over !!!

I have tried switching over to new broadband leads,,,same connector,,, but no joy,,, funny thing the fist mike works all right ???

If anyone has an easy fix, or an optional wiring,,, perhaps a foot switch would work ???

Thanks in advance _____ Peter EI4HX

As far as I know Yaesu has not corrected this very commonly reported issue in the current version of the MH-59 microphone. Several users in this group, however, came up with a simple solution which is illustrated nicely by the brief article named "MH 59 WITH TOROID COIL.doc" (117kb) in the files section.

Richard,

Just a quick follow-up in the event that you do not have "Word" or "Open Office" installed to read document files. Dean Gibson's article on this fix is still available on his web site at:

http://www.ae7q.net/doc/public/MH-59.php

A torroid using mix-43 (1-1000 MHz) would work very well in this application. They are available from many vendors, such as Palomar, online.

KB1QJK:

Perhaps two competing interests here. One is to keep noise and such that may be generated by the supply away from the radio. The other is the voltage drop from longer DC cabling.

I would think that with most modern supplies and equipment there's minimal concern about noise from the supply getting directly into the radio equipment, and as the 20 Amps or so that many radios take is significant current, I at least don't think it makes sense to extend any DC power cables to get the supply farther away from the radio.

Noise from the supply getting radiated and picked up by your antenna may be a different matter. Some power supplies do generate noise that, while it may not get coupled directly into the radio because of the rig's shielding, it may be radiated from the AC or DC power cables and be picked up by the antenna. That again is probably a reason to not add length to the DC power cable, but that can also be dealt with using RF chokes on both power cables.

The last consideration is related to lightning and power safety. If there's any chance of having an antenna be hit, or there being a nearby lightning strike, then you need to look at your station configuration from that perspective also.

So, in general I'd have to say that there should not be any real concerns about locating the power supply near the radio. Overall station design related to all safety, equipment protection, and RF factors may be something to consider, however.

The chief reason to keep the power supply close is that it keeps the power leads short. This radio can draw more than 20 amps, and at 12-14 volts, even a few feet of power cord can drop the voltage significantly. The reason to keep the power supply further away is to keep the supply from causing interference in the radio.

However, if you have a good power supply, noise won't be an issue, and you can certainly use the full length of wire that came with the radio without any problems due to wire resistance.

Just my two cents.

I have to take issue with this, shorter leads will radiate less
efficiently than longer leads, thus causing less interference.
Similarly, the shorter leads will pick up less RF when transmitting,
this, in both cases, providing other things remain the same.

If you have a "good" power supply, it will have seperate sense and load
terminals. If wired correctly, this will take the lead resistance out on
the equation, allowing a reasonable length of cable to be used.

They also generate less distortion and harmonics if AC, although most
radios are fed by DC so that is less an issue. And generally you only
see problems that way, which lowers RMS if you are talking about longer
than normal runs.

> If you have a "good" power supply

That also may be where experiences are different, not all power supplies
are equal. Some people may have had a bad experience with an older
supply or a cheaper one (cheaper technically not financially) and have
had their opinions tainted as a result. Then there is also proper
grounding of it, something many do not always do, and in some
circumstances is difficult at best to get a good ground (like in an
apartment).

27672. S meter Signal Strength

Yahoo group: FT897 (2009)
Date: 2009-09-10 05:07:57 UTC
From: roadtoscituate
Topic: 27672 Message: 27672

The s-meter indicates S++ for strong signals that I hear over S9. Since there is no linear scale for a strong signal measurement above 10dB over s9, where on the scale would an s meter reading of 20dB fall. And, what is full scale, 40 or 60dB?
Thanks,
Ron

FT-897 Bar Display Explanation

Sign in to the FT-897 Yahoo Group
Click on "FILES"
Search for Message 5278 - You'll find more than you ever wanted to know!

I forgot to mention the really simple answer. Go to W4RT Electronics http://www.w4wb.com/index.htm , buy an FT-Meter (best $45 I ever spent) and plug it in. Done! It has a very good numerically scaled back-lit dial. (you'll need an external 12 vdc 60 ma source for the illumination) (I modified a junk box 12 vdc wall wart).

Good Luck

Thanks for the pointer to message 5278, but I just wonder if anyone has done further tests on the S-meter's last two 'ticks' values - the original author thinks these are S9+10 and S9+20db. After working a contest last weekend I feel the values are higher. Also, as the author does confirm that the scale is linear, so between each S-point is 6db, the distance to the first tick after S9 suggests it's higher than S9+10db. Same with the second tick. Anyone done any serious tests with this?

I think the 897's S-meter is quite generous.

From the ARRL expanded test reports for what produces an S9 meter reading on 20M:

FT897: 16 uv
TenTec Orion: 135 uv
Yaesu Ft1000MP: 335 uv

The S meter on the 897 is very nonlinear and very
arbitary.

Here are some results om 80m I took recently:

The steps between readings are as follows:

S1 -2 1dB
S2-3 1dB
S3-4 0.5dB
S4-5 1dB
S5-6 2dB
S6-7 6dB
S7-8 8dB
S8-9 7dB
s9 -+10 16dB
+10-+20 20dB

There is no consistant step between 'blocks', and you can see that the step from 9 to '+' is 16dB and from '+' to '++' is 20 dB. The meter readings also change from band to band, are of course affected by whether the attenuator and preamp are turned on or not.

So basically the S meter is only an arbitary indication and cannot be relied upon to give anything other than comparative readings.

i got one of these mikes a year or so ago and experience problems with the ptt lock button. a friend also has the same problems. but it seems organic because for the last six months or so, no problems whatsoever. but earlier this year i had lots of problems. i didn't do anything to "solve" the problem, because it simply resolved itself? i don't know what i sound like, but i'm not very impressed with this aspect of the mic's operation. i use the mic mostly for daily 2meter activity (and once a week for a hf net) but wouldn't recommend it. it "matches" (visually and electrically) the ft-897 to which it is attached, and for those reasons i have it. 73 de charles ai4ot

Maybe I'm just getting (more) dense in my old age but I am having trouble coming up with a good reason to give a *&!# what the S-Meter reads, be it the internal bar graph or the external analog meter.
It has been shown that it is a very arbitrary reading that changes with, at a minimum, band changes and quite possibly with even minor frequency excursions. The variability of the output signal is going to remain the same, no matter what you use to read or interpret it. It has also been shown that three different rigs will give three different indications of signal strength.
Realistically, the only practical use for the S-meter would be for peaking the direction of a beam antenna and in that instance, the analog meter will be much easier to interpret.

Back in my hole,
Mike / W8DN

Hi Mike,

I tend to agree with you and normally only look at the meter to get anides of the signal strength or to see how much noise is in the background.

Having said that, I did, years ago, have a 2M FM rig, an ex-commercial valve unit, to which I added an S meter myself and then calibrated it in uV at the antenna socket. It was excellent for giving comparative tests to others for instance one time I was talking to a mate who was on top of a mountain about 300km away and he dropped his power from 120W to 10 W and I was able to tell him exactly by how much he had dropped from the meter.

Most of the time, however, I give reports from the overall sound and quality of the signal, like the days before meters were prevalent, not from some arbitrary meter on the radio which I haven't calibrated myself.

It is also very easy to make your own. It is basically a 1mA movement. I used the scales which are in the file section of this list and did my own meter using a meter I already had (I have heaps of various meters), added a pot to calibrate it (there is a calibration option in the menus) and it works great. I am about to mount my unit in a rack panel and am mounting the meter on the panel as well, along with an ATU and various other things such as a tune button which connects to the ACC jack at the rear.

The S-meter circuitry in my FT-857D is faulty, so I get either S0 (absence of signal) or S9++ (presence of signal) whether it's being read by the LCD bars OR the LDG FT-Meter.

Guess I'm gonna have to rely on the old "audio signal quality" standard for that rig, eh?

BTW: My FT-897 is working fine.

IARU Region 1 Technical Recommendation R.1

The International Amateur Radio Union (IARU) Region 1 agreed on a technical recommendation for S Meter calibration for HF and VHF/UHF transceivers in 1981.

IARU Region 1 Technical Recommendation R.1 defines S9 for the HF bands to be a receiver input power of -73 dBm. This is a level of 50 microvolts at the receiver's antenna input assuming the input impedance of the receiver is 50 ohms.

For VHF bands the recommendation defines S9 to be a receiver input power of -93 dBm. This is the equivalent of 5 microvolts in 50 ohms.
The recommendation defines a difference of one S-unit corresponds to a difference of 6 decibels (dB), equivalent to a voltage ratio of two, or power ratio of four.

Page number 17 in the service manual specifies alignment of the s-meter which is adjustable in the service menu -

SSB S-Meter Adjustment
- Tune the transceiver to the 21 MHz band in the CW mode. Inject an RF signal from the signal generator at 36 dBµ output.
- Select menu item "07: SSB-S9" and press the [A] key to set this parameter.
- Tune the transceiver to the 21 MHz band in the CW mode. Inject an RF signal from the signal generator at 86 dBµ output.
- Select menu item "08: SSB-FS" and press the [A] key to set this parameter.
FM S-Meter Adjustment
- Tune the transceiver to the 144 MHz band in the FM mode. Inject an RF signal from the signal generator at 0 dBµ output, with ±3.5 kHz deviation FM Modulation of a 1 kHz tone.
- Select menu item "09: FM-S1" and press the [A] key to set this parameter.
- Increase the output level of the signal generator up to 25 dBµ. Select menu item "10: FM-FS" and press [A] key to set this parameter.

You will need a calibrated signal generator to complete this exercise correctly.

The S-meter circuitry in my FT-857D is faulty, so I get either S0 (absence of signal) or S9++ (presence of signal) whether it's being read by the LCD bars OR the LDG FT-Meter.

Guess I'm gonna have to rely on the old "audio signal quality" standard for that rig, eh?

From: amccom2
Topic: 27688 Message: 27688

even with an automatic remote turner at the antenna end an 160 meter loop..out side the house of course. and big ferrites on all cables in the house on 160 always and on some parts of 75 it still feeds back sending the swr through the roof. Only running standard power.
no linear. even tried using two antenna turners. 40 and above no problem. Have had unit since 2003. sort of happ with it but still like my galaxy V that would tune up to a doorknob and operate flawlessly. Never had overload/feedback problems and with the galaxy I ran 1500W.... I can not believe I am the only person who has this problem. someone must has solved it. OK yes I have eveything grounded except my bid toe.

I had that problem. My rig is an 897D w/ LDG AT-897 tuner -- no linear. I added a new antenna (Buxcomm 8010CD) to my antenna garden (it's not big enough to be an antenna farm) and was getting RF feedback that locked the rig into XMIT mode. Only way to cure it was shut it off. It only happened on some frequencies and only on the 8010CD. The other antenna is a Hustler 5-BTV vertical on the tin roof.

At the Lockheed Hamfest in Fort Worth, I got talking to Bob from Balun Designs and described the problem to him. He recommended his Model 1113u 1:1 Isolation Balun. I bought one and installed it between the output of the tuner and the antenna switch. Cured the problem completely. Also, subjectively, it seems that the tuner doesn't work as hard to achieve a match on either antenna.

YMMV, but it worked for me.

It really doesn't matter in most instances. After all, the FP30 goes INTO the FT897. The only exception would be if you wanted to run it 50 feet away or so you would need heavier duty cables to prevent voltage drop.

Hello, I'm wondering does it matter how close, or far, the power supply is from my radio. Some people have told me to place the power supply as far from the radio as possible, while others have told me the opposite, that it should be as close as possible. I'm a relatively new Ham with alot to learn! Thanks in advance to all who respond. It's very much appreciated. Doug, KB1QJK

There are 2 other things to remember:

1. If you buy a linear (non-switching) PS noise will not be an issue at all.
2. Noise in a switching PS is related to the load it is under, and the greatest load will occur when you are transmitting so noise wouldn't be an issue then either.

The chief reason to keep the power supply close is that it keeps the power leads short. This radio can draw more than 20 amps, and at 12-14 volts, even a few feet of power cord can drop the voltage significantly. The reason to keep the power supply further away is to keep the supply from causing interference in the radio.

However, if you have a good power supply, noise won't be an issue, and you can certainly use the full length of wire that came with the radio without any problems due to wire resistance.

Just my two cents.

From: wa3jpg
Topic: 27688 Message: 27693

On 160 especially, and down on 80 I've had similar problems. The antenna (a loop) surrounded my house and I suspect there was just lots of RF floating around, even with the coax isolated (although you really ought to try a good isolation balun, it can work wonders if that is the path the RF takes!)

I found that my AC wiring was just plain picking it all up and feeding it back into everything plugged in. I used some AC line isolators and cured my problems. I've also found that hanging a nice quarter wave (tuned) "artificial ground" wire along the ground and attached to my radio has helped in such circumstances.

Best of luck.

Try a 9 meter squid pole, SG211 (has it own power supply), and goes from 160 meters to 6 meters. I use it portable. FT897 and tuner fit into a laptop bag no problems.

27697. RE: [FT897] S meter Signal Strength

Yahoo group: FT897 (2009)
Date: 2009-09-10 12:04:42 UTC
From: Michael Walker (VA3MW)
Topic: 27672 Message: 27697

David

The only way to get the right answer would be to hook your own personal radio up to a test set like an IFR and make your own measurements. You then have a calibrated device that you can trust. Anything other than that is 100% speculation.

The S meter on the 897 is not something that I would consider a device that is calibrated enough to consistent measurements and what you see on your may be different than your neighbours.

Subject: Re: [FT897] S meter Signal Strength

Thanks for the pointer to message 5278, but I just wonder if anyone has done further tests on the S-meter's last two 'ticks' values - the original author thinks these are S9+10 and S9+20db. After working a contest last weekend I feel the values are higher. Also, as the author does confirm that the scale is linear, so between each S-point is 6db, the distance to the first tick after S9 suggests it's higher than S9+10db. Same with the second tick. Anyone done any serious tests with this?

Subject: Re: [FT897] FT-897D and PSK31

I've successfully used my 897d with psk31 and haven't seen the same problem you're seeing. I've just set the mode to DIG and it's worked fine.
I haven't messed with any other menu settings so mine are set to the factory defaults.
I'm using the rigblaster plug and play with the cat plug that plugs into the rigblaster. So my rigblaster has plugs going into both the data and cat ports.
It looks like the menu items you've mentioned are set correctly. I'm thinking there's another setting I'm unfamiliar with that's causing the freq shift on transmit.

Hi David, thanks for the reply.

The antenna is mounted in the loft (its a mobile whip also) due to QRM from the wife not wanting antennas outside and runs very close to a G5RV half that runs down the eves of the house all be it the other side of the wall and seperated by an antenna switch close to the radio as 6m and the other bands come out of the same connection on the rear of the radio it separated the whip and G5RV as required.

I dont notice the issue when transmitting into the G5RV (via ATU) well not so id noticed anyway.

I've not got the radio earthed as such and was my next move to be fair I think though that im just asking for problems with the antenna in the loft and running so close to the other anttena and its ladder line feed.

The radio has just locked on TX when doing some testing so I've prob answered the question in relation to RF?

de M1AFY

From: "DavidN" <david@...>

If the SWR is only 1.2:1 I'd try connecting the ae. direct to the set to see
if the problem goes away. Also, do you have a thick earth strap connected to
the earth point on the back of the set?

From: Richard Corfield
Topic: 3918 Message: 27702

It's hard to advise as everyone's needs are different. I've done well with the 897 as base rig, but if you want to spend more there's better. There's also the possibility me separate radios for HF and VHF. I also have a mobile 2m,70cm in the car. The 897 goes camping and on RAYNET duties for which it is probably overkill most of the time. Internal batteries would make it ideal for that though.

I'd also consider the smaller 817 if you want portable. You can do a fair amount with 5W if your antenna is good or use an amplifier if needed.

These are all menu driven smaller radios. Menus force you to take things slower. The alternative is not so portable.

A good idea would be to find a radio club where there is chance to gain experience on different rigs and talk to others.

Hello group:

I was playing around with trying to load up my 60ft. long random wire antenna on 6m with my auto tuner the other day and noticed the same thing. Except the LED's on my FT-897D (no battery packs installed but have the inboard switching power supply) were lighting up quite brightly. It was while the tuner was going through the tune cycle and was having difficulty matching this oddball antenna. The antenna is fed with a single wire feeder which comes right directly into my shack. Once it found a match the LED's did not light up. When I use a "proper" 6m antenna which is farther away from my rig and fed with coax then this does not happen. In another situation while using my random wire antenna I've also noticed the lamp that illuminates the meter in my SWR meter will also flicker brighter when I transmit. I would guess these two cases to be some sort of RF-in-the-shack situation.

I'd use what I usually bring when portable: a fishing pole.
I have an 8 m fishing pole that I attach a wire to, at the bottom I place a tuner and to that I spread a few radials.
Its very easy to bring along, cheap and works great.

Try a 9 meter squid pole, SG211 (has it own power supply), and goes from 160 meters to 6 meters. I use it portable. FT897 and tuner fit into a laptop bag no problems.

No question.... ..Buddipole! Quick, easy, configurable as a horizontal dipole, beam, or vertical. Sets up in minutes. Can be used throughout all bands.

From: iz0inx
Topic: 27704 Message: 27707

Yes it is. This has been discussed several times on this group, try to search for CAT and will find the information you need.

Anyway, my contribution is on the Files section, take a look here:
Files > CAT & Sound Card Interfaces > Just CAT converter > CAT-Mic.doc
and on the related discussion from the msg #27528

cheers,
Fil IZ0INX

From: aa5tb
Topic: 27672 Message: 27708

Mike,

I agree.

With the proper use of the "IPO", attenuator, and RF Gain the S-meter is readered useless anyway. I depend on the RF Gain to recover the original dynamic range of the signals to give my brain more information to work with. Since the S-meter just reads AGC voltage and the RF Gain is doing its thing by adjusting the AGC voltage the minimum S-meter reading is modified by the gain setting anyway.

A great antenna for this trip would be the HFp made by the Ventenna Company
I own one for back packing. Easy to set up and works great. Comes complete and only weights 2LBS. Great antenna for the FT-897 or FT-817

Check out at the Ventenna page.

http://www.ventenna.com/index.html

Check out the reviews on e-ham. Interesting to read the reviews.

It is Switch 1001 and is used when aligning/adjusting the pre-driver and exciter idling current. You never need to touch it unless you have the correct test equipment and plan to re-align your transceiver.

From: kb4mto
Topic: 27712 Message: 27712

Is anyone in the group using the Heil GM-4 or GM-5 microphone with the FT-897D? I am going to buy one to replace the stock hand mic, but wondering which one I should chose with this radio. Also, how does the mic do when switching over to VHF FM, and which element is best for FM communications? Finally, are there any menu settings that should be adjusted when using this mic for HF and VHF?

I have heard so many good things about this mic, but I want to make sure that I make the right choice.

Thanks for any help y'all can provide.

I use a stick mic brought off eBay for ?10 took out the standard element and fitted a HC5. So far reports are good on FM natural sounding but little bass.
I had the element in an old headset and reused the element. Saving ?'s on the genuine mic that I can put towards the stand.
Hope that helps

I have tried to use my GM-4 on my 897D/857D and it sounds terrible.

However......

I did nothing to try and tailor the radio to the mic. I just plugged it in, as I did on my TS2000.

You might give Heil a call or email them and see if they have any suggestions for radio settings. Expensive mic to buy and not like.

I also have a GM-5 that was given to me because it sounded awful in the environment it was installed. It works (sounds) great on my Kenwood TM-331a, 220Mhz radio.

<snip>

I've had similar troubles with my FT-100D. The RF gets involved in the house somehow and in my case makes the carbon monoxide detectors go off and/or resets the clock on the oven or turns on dimmer switches.

I built an "Ugly Balun" and that resolved most of the trouble. The "Ugly Balun" is an air-core choke that you put as close to the feed point of you antenna as you can. It consists of 20 or more feet of coax coiled in a single layer over ANY round form. The number of turns is not significant, just the 20+ feet. Of course the form has to be non-metallic. I used a plastic coffee ground container with the lid held on with duct tape to help it keep its shape. I just turned 20' of the feed line around the coffee container and fixed it with wire ties. No need to use SO-239 connectors, etc. Just get the twists in the line and keep the cable in a single layer.

You can Google "Ugly Balun" to get instructions.

From: Clark
Topic: 27716 Message: 27716

Just curious, are there any new internal battery solutions for the 897 these days? I've finally burned through my FNB78's and they're sagging as far as I can tell. I may buy a new pair, but also thinking of the lithium nanophosphate ones (A123) sold by buddipole - though they won't fit inside the 897 they're small, light and will deliver enough current to run a full 100 watts for a while. Man, I wish there was one of these designed to fit inside the 897, I'd pay real money. If anyone has seen such a thing, please let me know.

This sounded like an interesting challenge and unfortunately I turned up nothing. Not even on the Japanese sites. I did find Spanish but no other languages. I even search Google.jp using the string "ft897操作マニュアル" and nothing turned up. Even the Vertex-Standard Japan web site at http://www.vxstd.com/jp/index_jp.html has nothing in the manuals section for the FT-897 series. They do have mostly older manuals available in Japanese at http://www.standard-comm.co.jp/cgi-bin/amateur_index/manual/manual.cgi . However, they do have the FT-450 CAT interface document in Japanese on that page. While it is not the FT-897D, maybe there is something useful in there that may apply to the FT-897D.

I emailed the guy at Vertex that deals with ham radio inquiries and asked him, he gave me another email address, and I asked them and got nothing.

The only reason I originally wanted this was to map out what you *can* set as an alpha tag for memories if you write to the eeprom directly (possibly if you use the clone function as well since that should be basically the same thing). If you use the dial it caps it at what is in the US manual (at least for my US version radio). I only noticed this by trying to create the map of what was available and incrementing the values and decided to go past what was in the book just to see.

I have more information on this at http://www.0xdecafbad.com/?p=154 but here is the basics of this particular subset.

Each tag can be 8 characters. 0-157 decimal correspond to what is in the book. 158-215 are Kanji, and 216-255 are blanks. The graphic that I have on that page is not a direct first char is 0, 2nd is 1. It is the image from the manual. I have another that I plan on uploading which has them in order so that you can more easily pick what you want if you are writing software to program the memories. The only provision That Yaesu has given to program memories is by cloning or by writing directly to the eeprom.

CAT does not let you directly program memories, this is in part because CAT uses a fixed 5 byte command sequence and a memory for the FT-857/FT897 is 28 bytes (20 bytes on the FT-817 iirc).

It is possible, although I think unlikely, that the memory map can change with different versions of the firmware. It appears that this map has been fairly standard over different versions.

I wrote the perl library in the hopes that others would write the useful software that actually does something meaningful :) For example, the perl library (module) would make it fairly simple and straight forward to tune the radio to a satellite frequency at specific times of day and even retune the radio for doppler shifts.

27724. secret CWIDs ??

Yahoo group: FT897 (2009)
Date: 2009-09-17 04:08:01 UTC
From: Trixter aka Bret McDanel
Topic: 27724 Message: 27724

This email is not about freebanding or anything that way, but rather about exploration of the radio itself. I use that as an example because that is the only example that I have found so far, so please lets not get into a freebanding discussion, it will detract from what this email really is about :)

What I am looking for is anyone with any knowledge about any of what I am going to talk about. Someone else has to have heard something somewhere :) If you wish to remain anonymous, email me off-list and I will forget your name.

I noticed that the CWID on the FT-817, FT-857, FT-897 is not in the main eeprom. It is located on the eeprom in the cpu (used for bootstrap and things mere mortals shouldnt be editing such as where you can and cannot transmit - bandplan data).

I also noticed that if you set your CWID on a VX8 to "AH029M " and press magic button sequences while turning it on, it will freeband it (this does not appear to work on all of them, so if it doesnt work I dont care, dont tell me about it :)

This got me to thinking, why would they put the CWID in the cpu eeprom, which is used for bootstrap code, and to bring up the bigger eeprom which contains all the alignment and configuration setting data.

The only thing I can think of is that the CWID is used during the bootstrap process. This would be before you can use the radio, before the main eeprom is available, before much of anything is done with the radio. This got me to thinking about the VX8 mod, and how it might be that there are SEVERAL different CWIDs based on radios (it could even be based not just on model, but manufacture lot numbers, etc). They can enable different things to occur.

For example there is an undocumented command via the CAT port that appears to do nothing other than to return an error code. It may be that it does something only if you have the magic CWID, and possibly boot up holding magic keys down. Other commands may present themselves as present at that time as well. This could be how the firmware is loaded onto the cpu eeprom (which if toasted *will* require sending the radio to Yaesu, the main eeprom if toasted will just require recalibrating the radio and reprogramming all your settings and memories). I have to believe that Yaesu has an automated trivial process to upgrade the firmware, probably via the CAT interface.

Above and beyond the firmware there are potentially other things that the radio could possibly do. Of course if you could get access to the firmware it is possible that you could at the very least enable

additional memories, there is space on the eeprom. Although I wouldnt want to play around with that unless you had some way to write to the eeprom on the cpu if you screw up (JTAG?) :)

Thanks,
kc2dwq

the problem is that they want batteries that output a lot more juice so that they can run the radio longer than the "manual" 8 hours, and potentially go over the limited Tx power output that occurs when you run on the internal cells. So far I do not think anyone has found a size compatible battery of the material that was originally requested (lithium nanophosphate).

If a size compatible lithium nanophospate could be located the it should increase the run time on batteries, even if its only at 20w or whatever it does on batteries. Having them external would allow you to go 100w, at least in theory.

I do not know if its a power output from the cells themselves that causes the lower Tx power or if its the radio saying "we are getting power from inside, scale back". I think its the radio detecting where its getting the power from (ie if the battery icon is present tx power is lower). Voltage appears to be the same whether I am on battery or not, although it could have some current limiter to prevent cooking the battery/radio by sucking power too quickly and that is forcing the lower Tx (or the lower Tx is acting like a current limiter by design).

Hello Bret,

"upgrade the firmware, probably via the CAT interface"

I have no knowledge of the Yeasu process but:

Connector J1010 on the Main Unit circuit board is a vacant connector. The service manual (897 cpu 2.jpg, top right) shows this,

J1010 connections are: 1. GND
2. RXD
(MIC-UP)
3. TXD
(MIC-DN)
4. GND (pull-down) (MD1)
5. +5V (pull-up)
6. RES
(REQ)
7. VCC
(VCC)

also the CPU (897 cpu 1.jpg, bottom left corner) shows

Pin 1. RES (reset?) (REQ)
Pin 4. MD1
Pin 79. MIC-UP
Pin 78. MIC-DN

To me, this looks supiciously like direct CPU programming.

On the subject of "Free-banding", I don't really want to encourage or advise people to do something that they really should think about first.

For that reason, I have not publicised or distributed what I have discovered from reading the service manual and testing. For those who are interested in how a tranceiver works, than I have no issue with that, use the information as you like. See FT-897 Jumpers 1-9 xls, incomplete and very likely lots of errors

The best of luck,

Geoff, vk2agc & vk2hef

I had the same decission. Unfortunially the GM mic comes with only one element. The 5 is great for rag chewing, sounds wonderful, and the 4 is for DX and cutting thru noise, sounds very "raspy" not the greatest for FM use. So I bought the HM10 DUAL mic. That has both elements and switchable from one to the other. I love the Heil, you will not go wrong. I use nothing but. Got the pro set, Travler dual and 2 older hand mics that are not in production anymore. You do need to turn up your mic gains to about 85. That is the only adjustment I made (per Heil recommendations).

You may have the wrong adaptor cable or you may have the adaptor screwed in wrong. Make sure when you swrew in the small adaptor cable to the headset cable that it is in the right position (it is keyed). The two small phillips head screws will line up. If all else fales give Heil a call. Their support is great.

If you haven't already, you may want to look at W4RT web site. I switched to his batteries and fast charger when my original Yaesu ones gave up. Work very well and charge in just a few hours. (use the FT817 batteries also)

I hate to use external batteries (unless field day) because that takes the "portability" out of the radio.

do you mean a carrier or the rf meter moving on SSB with no audio? if so its the mic picking up either background noise or rf pick up, (i had both these using the 897 & heil pro)

Thanks

Hello FM,

I have following problem.

When I connect my Heil Pro Set to the radio with the cable I need and when I push the PTT I have a carrier even when I dont speak in the radio.

When I connect the original microphone I don't have the problem.

All info welcome.

Hi Larry - The W4RT batteries are really the same thing (cheaper and made by friends, though!) and I've always used their chargers here. Its just the NiMh internal cells do not allow for 100 watt operation at all, the new LiNo (did I get that right?) batteries (see buddipole site under "power") will give you the same a/h rating, roughly, as one of those NiMh batteries but its internal chemistry allows you to go ahead and draw 20 amps on transmit (even under contest transmit conditions, another ham reports he did this for an hour at 100 watts and the battery was still up for him.) I am very hopeful someone can develop a pack out of these cells that will fit inside the 897, it looks like the standard size is just a tenth of an inch too wide or something and then there's the shrink wrap covering.... but wouldn't it be nice to have the radio available, with internal cells, for up to 100 watt operation for an hour or two? My fondest wish.

I'll probably pick up a 4.3 a/h external pack and use it a lot to get familiar with how these things work. Almost double the price of the NiMh replacements, but so very flexible.

The nano-posphate batteries put out more amps for higher owered radios.

They occupy more physical space for the same AH capacity so it is hard to get the same AH into the battery compartment.

They do make the radio lighter and the wallet much more lighter.

If you do not need the high amperage producing feature they are not economically feasible to use .

Lithium Ion's are the better deal if you have the proper charging and discharging cutoff circuitry.

Most newer HT's come with Li. The charge circuitry is built into the radio , just as in a laptop.

Charge and discharge is simple but critical in charge and discharg voltage.

Ideal here would be as much capacity as possible in the space, and for a good price. I'd like the portability of using internal battery packs, and also any features the radio can give in terms of power management. The 20W limit is not a problem. I'd reduce power to increase battery life, but even at 10W with two external 4Ah NiMH packs it doesn't feel as if I could rely on it to go all day.

Rudi,

It has been my experience that the RJ-45 plug that Heil supplies DOES NOT FIT the Yaesu front panel audio plug. Heil says it does and Yaesu say its not our fault. There is definitely a problem with the plugs. So far, I have not used my Heil Headset with the FT-897. I might try going to Lowes , Radio Shack, etc. and buying a replacement RJ-45 Plug and see if it fits the FT-897 tightly.
(The problem is a "Form-Fit-Function" problem between the US and Japanese specification standards. What else can I say ??. its a REAL problem !!)

It is a Chinese problem. Every time some one copy's something instead of doing thier own engineering the tolerances get larger .

It goes from USA -Japan-Tia won-China. Then some one like Wal-Mart sends a Chinese copy to China to be copied.

I have seen problems with German and Italian copies also in the past.

Personally I have found RJ-45's very reliable. If they werent commercial two way radios would not use them . It is when some one makes a cheap copy of a cheap copy that their are problems. Look at some things at Radio Shack lately.

DE N7UVL,
While I have no experience with the Heil RJ Connector,
I have had many experiences with the RJ connector
itself. I have found a variety of RJ manufacturers
use different spacing & thickness between pins & the
plastic separators. I have found pins hung up due to
a mismatch between the plug & the socket. Some RJ's
have a "guide" plastic tip on the outside that can also
cause a mismatch. Although not a "catchall", I've
had the least problems with Amphenol RJ's. And got
those from "Graybar"./ga

When I got my FT-897D I was very surprised that there were no memory programming calls in the CAT interface. The other rig I have been using for a long time (and still use) is a Yaesu FT-757GX II and that does support memory programming through CAT. It only uses six bytes per memory channel (frequency plus mode) but that is still too much for the five byte CAT interface. Yaesu's FT-757GX II solution is quite simple and I am surprised they did not carry it on to the newer rigs:

1) Using CAT, select either VFO A or B.
2) Set the desired frequency and mode.
3) Issue the SET MEMORY CAT command and specify the memory number to copy the VFO to.

Granted there are only ten memories in the FT-757GX II but Yaesu could just as easily have implemented CAT control for writing the FT-897D VFO to a selected memory. I wrote a C# program for saving and restoring the memories on my FT-757GX II. All I do is; 1) remember the VFO A settings and currently selected memory channel, 2) read in the saved memories from an XML file and write them one at a time to VFO A followed by a save memory to the specified channel, 3) restore the save VFO settings and memory channel when completed. I never bothered to write a similar application for the FT-897D as it was easier to purchase FTBasicMMO and have someone else support it! Plus I did not want to muck around with the EEPROM or reverse engineer the cloning protocol.

There is also the ADMS-4G software package for programming the FT-897D. That package appears to use the various undocumented CAT commands (read/write EEPROM?) to program the radio. I do not have the software package but I have read the documentation and there is no mention made of going into clone mode to use it. It is rather annoying that Yaesu has created these "undocumented API's" for the radio making it difficult to do certain necessary things.

From: eric@van-de-weyer.org
Topic: 27660 Message: 27742

Hi Robert,

I really don't see your problem, at least you can program it. If you had
an FT100 then you would NOT be able to computer program or clone it as there
is no CAT command to do so. It is the one major drawback of that radio (and
I have 2 of them). Other than that, though, they are an almost perfect radio.

73....Eric VK2VE.

historically ADMS by RT uses the clone featureset, and not the CAT
featureset.

The clone lets you transfer all memories and the radio takes care of
where to put them. The downside is that you have to put the radio into
a mode that precludes it from being used, transfer the entire memory
contents, then put the radio into a normal mode. The upside is that its
a supported feature by yaesu so if something goes wrong you can complain
to them instead of being told that you were doing naughty things.

I tried to retune to an Ham band and it does not work, I have to keep this extra band and live with it but I don't like it. The first time it happened I made a reset to the factory settings (V/M pushed while powering the rig) which scrapped many memory settings, I won't do it again as I had to rewrite some memories and it takes time but I would appreciate to find a way to eliminate these extra bands as I fear that in a few months I will have to move through hundreds of extra bands as I like to listen out of Ham bands.
If anybody knows how to do it, many thanks.

This extra-band is not so bad after all. I did some checks on the rig and understood that there is ONE extra-band for VFO, it moves and stays where you left it. I moved it to WWV 15.0 Mhz where it might be useful for fast frequency test and time checks.

27746. LITHIUM ION BATTERIES

Gents . . .

What's the latest on Lithium Ion batteries and their propensity to explode?

Haven't heard much in the last year or so. There was an impressive clip on YouTube showing a laptop melting before your eyes due to the extreme heat generated by an errant Lithium Ion battery.

Pulling 20 amps out of them (that's a big battery) would seem to me an excellent time to wear asbestos.

that is why the lithium nanophosphate is supposed to be so good. Its basically a lithium ion battery enhanced with nano technology. They can drain faster without battery damage as well as charge faster or something. They should be less likely to explode.

I have/had the same problem, but it was only on the HF bands...never occurred on VHF/UHF. This of course would only happen when I had my foot switch plugged in, I could remove the foot switch and use the PTT key on the mic and it would work fine. After testing every connection known to man, I noticed the cable for my foot switch was wrapped around my HF coax on the way out of the shack. I simply moved the two cables away from each other and it magically stopped "self modulating". It appears that there was a little bit of RF getting into the foot switch cable. Let me know if this helps you in any way!

Popular topic, and lot's of misinformation out there. Here's a recent post on the 857 list:

Mark wrote:

> > As for the other Lipo features.
> >
> > Yes they blow up and catch on fire if charge wrongly or short circuited.
> >
> >
>
Not quite that simple. LiPo's (Lithium Polymer) should not "blow up", though they can & do catch fire. LiIon's were more violent in their reaction, but even then it was not an explosion in the "bomb" sense with a chemical whatever-thermic reaction, more of the case popping and burning. It's a lively event, no question about that... but it's not an explosion in the same sense as gunpowder or other explosives.

The later Li variants are even less likely to burn/react, some are considered safe as NiMH in this regard.

That said, NiMH, and NiCad's both can "explode" in the same sense that Li-Ion can if mishandled. It's pressure venting in the case. And they can burn, but are far less likely to and usually easier to extinguish.

Lithium *primary* (non-rechargable) are the source of the most concern, as they are very hard to put out. They are also the source of most of the airline/freight battery fires of note. Consumer Li-Ion packs do have incidences, but are not the same source of concern to the NTSB as they can be extinguished easily. This is born out in the regulations regarding air travel with Li* batteries. Unless you have a huge (and very expensive) Li* array, you can carry them on with no problem. Check to make sure, do the math on the watts, etc.

Key on all of these is to avoid shorts, charge with an appropriate charger, and don't charge unattended. For the larger hobby Li* batteries most people charge in an ammo can, or aluminum pan. Some use a small sandbag on top of the battery, if it ignites the bag melts & smothers the fire.

Again, non of this is exclusive to Li* batteries, short circuit a NiMH or NiCad and you'll have a problem and potential fire, just maybe not a dramatic.

On the voltage issue, Yaesu spec's 13.8v +- 10%. But the real limiting factor is what are the components rated at, etc. Some are borderline for that spec, some have way more headroom. The fact that the 897 factory NiMH's slightly exceed that spec at full charge tells you there is some headroom there.

I've used an 857 installed in a '03 pickup for 100k+ miles, no problems. So like yaesu indicates, it's safe to use in "12v" vehicles. If you had exotic battery technology that you knew routinely exceeded the spec, then put a diode drop or to in series to knock it down .7v. Use a power silicon rectifier diode with appropriate current rating, parallel matched devices as needed. Using 2 legs of a full wave rectifier is a good way to get matched diodes cheaply.

For portable Li* usage, use a couple of diode drops as needed when the battery is full, and have a switch that can bypass the diode drops (just put the switch in parallel) for when the battery voltage is lower. If you were clever, you could have a latching relay setup that did this automatically.

Have fun,

Alan

27756. Question re: auto tuner operation

Yahoo group: FT897 (2009)
Date: 2009-09-18 23:22:35 UTC
From: thb201
Topic: 27756 Message: 27756

Hello group:

I've recently purchased the new dedicated LDG YT-100 tuner for my FT-897D. So far it seems to work quite well but I'm still running it through it's paces with various antennas. I've also have an SGC MAC-200 auto tuner that I bought some time ago. Already I've noticed a significant difference between the two. The SGC is the only auto tuner I've had any experience with prior to purchasing the LDG YT-100.

I have a shortened 40m vertical that is quite narrow in bandwidth. I mostly operate in the lower (below 7.100 MHz.) portion of the band where we hams in Canada are allowed to operate phone. When I move up the band the SWR of course starts to rise quite rapidly and I need to re-tune. With the LDG tuner, if I've first tuned up on the bottom of the band and then move up in freq. I have to push the tune button again to re-tune. However with the SGC tuner I don't have to do anything. As soon as I transmit it automatically senses a rise in SWR and goes into a re-tune cycle on it's own. In fact the SGC tuner doesn't even have a tune button. It measures the transmit frequency, checks the match and then goes into an auto tune cycle if the SWR exceeds some preset limit.

As these are the only two auto tuners I've ever used I'm curious as to whether or not the SGC is unusual in this way, or is it more common to have to push a button to re-tune as with the LDG tuner. I notice other LDG tuners also have a tune button, as do many rigs with internal tuners. I guess what I'm wondering is if the SGC is a "true" auto tuner in that you do not have to intervene in any way with it for it to do it's job, while the LDG tuner might be more correctly called a "semi-auto" tuner in that it will auto tune once you have manually told it to do so by pushing the tune button?

I will say that having true one touch tuning with the LDG YT-100 (not having to switch to a constant carrier mode, reduce power, tune, and then revert back) is really quite nice. Even the SGC won't do this.

Thanks in advance for your comments.

> David G4TUP.

That is on SSB and FM both. When I got my mics the recommendation was to turn it up. I tried to find the instructions all I could come up with is the pamphlit that came with the mic and in it I quote from Heil...."Mic Gain--Adjust the mic gain while watching the ALC meter. Adjust so that the audio peaks just fill out the ALC scale and do not go beyond the ALC scale." also the mic is made not to talk more than 2 inches from it. These mics are very sensitive. They are made so as not to pick up background noise, hence the turning up the mic.
I leave all my radios on 85 mic gain all the time and have very good reports. When I listen to myself from another receiver the Heil is 110% better sounding than any of the Yaesu standard mics.

Larry / nr3r

Hope this helps.

There is info on the Heil page on setting up a heil mic on the rigs which would be worth checking.

I checked with them and got the following for my 897/817 set up:

"Generally, we recommend that you start with the 897 DSP EQ turned off. Then, especially for DX working, set the TX USB CAR and TX LSB CAR menu items in each radio for a positive shift, perhaps +100 to +150 Hz. That will give lots of good zip to your signal, and particularly in the case of the 817 it will really help your DX results.

Once you get the carrier shift set up right, you may experiment with the DSP EQ on the 897 (the 817 doesn't have this, of course), but I suspect you'll end up leaving it off."

I use the Dx insert and on HF SSB have the proc level @ 70 and mic gain @ 40 on FM the mic gain is 10.

From: Ron
Topic: 27760 Message: 27760

Hello, Reader

As a newby, i wonder how to setup the ft-897 for use on the VO52 satellite, how must i do this, i have seen a lot of movies on youtube, but is this also possible with the FT897, and how must this been done.

Perhaps someone use this radio for sattelite comunication and is willing to explain this to me, or perhaps someone can give me a link to read something about using the ft897 with satellite,s.

Thanks for reading this question and perhaps you have the help that i need.

Kind regards

Ron Snijders (PD1ANB)

There is a section in the ft897 manual that runs you through the setup for AO-51 (i think) as an example. It's pretty clear on how to do it.

John:
"The YT-100 provides semi-automatic antenna tuning". This is in the manual for the unit.
It's a great tuner and has plenty of memories and will tune, manually/automatically in a second from memory.
It is also less than 1/2 the price of the other and works faster as you already know... hit the button and go.

Yes, this would be a solution, but the question is that all the filters look like to work in this way.
I have the same setup, with original Yaesu filters, and I experienced the same problem.
It's very strange that Yaesu suggests in the ueser's manual to activate in also TX the narrow filter in PSK31 and then, with the normal settings, nothing works ....

27767. please help me decide: 897D with internal batteries vs. 857D with external batteries

Yahoo group: FT897 (2009)
Date: 2009-09-21 07:17:16 UTC
From: ZephyrNewYork
Topic: 27623 Message: 27767

Greetings all,

I need some decision making help. I thought I was going to purchase the 897D for portable and base use, but I recently found out that the 857D can be used with lightweight batteries such as Buddipole's A123s. Now I have some questions:

1. What are the pros & cons of the 857D with Buddipole A123 or other external batteries vs. the 897D with internal batteries?

2. Do the A123 or other aftermarket batteries last longer than Yaesu's internal 897D batteries?

3. Do the aftermarket 857D batteries just hook up to the radio, or is there a case for the batteries?

4. Are the aftermarket 857D batteries water resistant?

5. What is the difference in weight and size between the 857D with external batteries and the 897D with internal batteries?

6. Who has pix of their 857D with such batteries? Please post.

Thanks.

73,
Frank

external batteries means something external to carry, cables to bring
along, etc. The 857 is smaller than the 897, so that offsets some of
the external issues.

the 897 with internal batteries will run lower power outputs (20W iirc
on all bands) when using the internal batteries, however external ones
that provide enough current will let it to full output.

I selected the 897 because I have the option of both internal and
external batteries. I can run the DC wiring harness into a battery bank
if I want to, or I can just 'grab and go' with it using the internal
batteries. My friend opted for the 857 because he is poor :P

As for cases for the batteries, it depends, if you get a deep cycle at
walmart you can also get a battery box for it, and even use that to
mount molex connectors, cigar lighter adapter, whatever you need on the
same box so its a "grab and go" battery pack. If you wanted something
smaller you could do that as well.

Or, use 897D with external battaries. That would be my choice,
and that's what I have.

Look, for all the things the 8X7 is, it's not quite power-efficient
in receive mode and the box *will* drain the internal battaries in
just a few hours. In that regard, the capacity of the internal
cells (and hence the lifetime of a single charge) isn't impressive:
you won't listen on them for very long.

Charging the 897 cells, with an external wart en extra cabling,
is a major pain, and only one pack can be charged simultaniously.
The 897 with internal cells weighs quite a bit, obviously the same
total weight as an 897 w/ external cells but then the weight
can be separated when you are carrying things.

When you use the radio in base, the built-in power supply is darn
convinient. When you go out, an extra power cable and the
battary-pack-du-jour is all you need to get off-grid.

There's a lot of developments in battaries in the coming years,
and IMHO it doesn't make sense to lock yourself with
(legacy) NiCd/NiMh cells. If you do use other technologies,
then a simple interface "this is where 12Vout is" is a lot
more simple than finding that you can't fit the new cells,
can't charge them without a special charger, can't swap them, etc
Be it the Buddipole A123 or some future product, a pair of powerpoles
(or, heaven forbid, 2 12V banana's, as I have them).

The 8X7 (x=5,9) uses more than 1A with receive alone. A 2.3Ah pack
isn't going to last long, and even a 4.6Ah pack will be gone
after just a few QSO's.
Simple, gell-cell lead packs are relatively cheap (7Ah is used
in burglar alarm systems). They'll be gone in 3 years,
who knows what technology exists then.
Just build one in a compact wooden box, with switch, fuse and handle
and you'll be good to go.
Neither the A123 cells, nor the 7Ah, will stand a long extensive
ragchew on 100W. It's just a different mode of operation.

I do think the buddipole packs are spectacular but would suggest
an 817 or K2 or thereabouts, it's a closer match and for that,
very tempting indeed.

I buy my batteries online at a place like Farnell or a local outlet,
though the latter is diminishing unfortunately.

For 12V 7Ah packs, ask a burglar alarm maintenance person as they
typically pull the packs after 3 years of service.
Often they are past their prime but sometimes they have some good life
left into them, and given that they are chemical waiste and cost
money to dispose of, these techs are usually happy to hand them to you.

Again, this is the raw, generic battery. Built wooden box, add banana plugs
and fuse and have something modular and generic that fits all my radios,
in fact all my 12V portable requirements.

Also might try the Biomed Dept at your local hospital. I used to work in the hospitals IT department and got to talking to the manager of the biomed department and come to find out a lot of the medical equipment they service uses SLA type batteries that they are required to replace ever so often. A lot of times the batteries were perfectly fine. They were taking them to the scrap yard so I asked if I could take them and they let me have all I wanted. Most are nice 26ah batteries too. So hit up your local Hospital. You never know what you might find.

27776. BHI DSP for PKT/Data 1200 BPS out too

Yahoo group: FT897 (2009)
Date: 2009-09-21 21:21:01 UTC
From: whiskeyalpha2tango
Topic: 27776 Message: 27776

Greetings guys,

Just wanted to see if anyone has already done this (as I plan on doing) along with the install of the BHI DSP module. I want to have the DSP benefits available for use on digital modes as well, here is how to do it:

Stand C1473 on end, lifting the end connected to R1444 (why the 897 install instructions says to use a 10 nF instead of re-using this cap I dunno). Then, disconnect the end of R1444 from the end which connected to C1473 and either stand it on end as well or angle it toward the end of C1473 that is still connected to the board. Flywire the open end of R1444 to C1473 (board end). Connect the BHI module as instructed but connect the blue wire to the open end of C1473 thereby using it as the DC block (instead of another cap as suggested).

Now, the input to the 1200 BPS out op-amp is connected to the DSP module output instead of before it and the DSP module will improve both the rig audio and the PKT/Data 1200 BPS line out.

Thoughts and/or comments welcome.

73,

Bob, WA2T

I am a PSK newbie so forgive me if this is a silly thought but I thought the idea would be to open the IF up as far as possible (like SSB or even a cap across one of the filter positions I have seen somewhere?) so one can decode as many signals as the program is able to? Using DM-780 and the superbrowser (very cool BTW), it uses most or all of the audio passband and shows multiple decodes of streams.

What is the other side of the coin so to speak? Eliminating QRM? I have yet to see a QRM situation in my limited experience in what seems to be the "usual" frequencies on the bands open at the time.

Monitor your voltage output from the power supply on a DVM
or better yet oscilloscope.
If you have a scope try looking at the ripple. Suspect a bad
power supply or connection.

Thanks, everyone. This is definitely good to know, especially since I'm a paramedic and supposed to be in the hospital all the time anyway :) Is there another name for biomed department?
73,
Frank

Click or copy the link below to help a Paramedic & other volunteers provide free medical care to poor children & adults in a very remote location who otherwise would not have access to medical care. Any type of help will be appreciated. If you're unable to donate, please spread the word :)

Topic: 27623 Message: 27785

Bob, you are absolutely right, when we are looking for an interesting signal on the waterfall, the wider is the band, the higher is the probability to find something.

However, when you find a very weak signal, coming from a most wanted country, you don't want that another strong and splattering signal, close to the weak signal, makes impossible to decode it.
At this point you will appreciate the use of the narrow 500Hz (or 300Hz)filter which will allow you to exclude the disturbing signal from the interesting one.

Again, as suggested in the user's manual, you may want also to set the filter working on TX, in order to make clean your emission avoiding possible spuries.

The problem which was raised up by the initiator of this discussion, is that the TX band window and the RX band window are not located at the same position, often making the transmission impossible .

In other words, it may happen that if you activate both, the TX and the RX filter and put the trace at the center of the window, when you go in TX the emission is cut away by the effect of the TX filter, which is located abt. 500Hz far from the RX one.

Hope to have been able to explain, even with my bad English ... :-)

cheers,
Fil - IZ0INX

There is a separate audio gain in, but I'm not aware of an audio gain out setting.

It's 600 ohm typical audio levels. For all the TNC/modems/psk cable's I've used it's been more than sufficient, usually had to turn it down.

Have fun,

Alan

I ran into this feeding a PK-232. I called Yaesu and had a lengthy chat but to no resolve. As I remember (this was over a year ago) there are two audio outs at the data connecotr. I ended up using the 9600 baud data out rather than the 1200 baud data out and that worked in my case.
There may be some buffering in the 1200 baud line, I don't know, I an not
an engineer.

FWIT, the levels that are adjustable in the radio are for audio comming into the radio. Not for transmit.

When I called Yeasu back to report my findings, the fellow I spoke with said those two were in tandem and as to why there was level defference he did not know. But did mention shat he had fielded the same question in the past.

Try it and see...

I'm pretty sure the 9600 baud signal comes directly off the
FM discriminator and will only work FM. 1200 baud passes
through some additional circuitry and covers all modes.

I wonder if an easy answer is to build a little amplifier for it - maybe a transistor or op-amp circuit. A transistor circuit could be made small. At least one of the DIN sockets on the back has 13V available on one of its pins.

From: whiskeyalpha2tango
Topic: 27783 Message: 27791

I thought I needed to do the same thing until I discovered the mic gain slider in windows that is! Have you messed around with this at all? Once I found that, I was able to provide more than enough inout to drive the soundcard, even into overload. My microphone gain slider is set at around 15% for 50% drive into DM-780.

Otherwise, there is a way to increase the level, but it would involve changing the op-amp gain on what feeds that output. Assume most would not want to do this (although I was in there modifying the SMD's for my BHI DSP last night). Not for the faint of heart. I use a microscope and two soldering irons simultaneously to do SMD work.

And I was using FM (APRS) so you may well be correct. As I said, I am no, software, broadcast or RF engineer. Just relating my experiences.

Now for HF data I use a homebrew interface using two radio shack audio transformers with audio taper level controls for both IN and OUT and it works great. (total build cost under $10.00)

I built another interface using optical isolation with transformer matching (along the lines of $20.00 build cost) and found absolutely no improvement except for perhaps mental gratification.

In the last 12 months+ I have tryed HRD, Pactet RTTY, PSKxx, MTxx, Slowscan and the routine modes and I really like this radio. For what it does, it does it damn well and at a most reasonable price. And whips the pants off the Icom 706MKIIG here at my house...

I really wish some enterprising individual would come up with a lucite, polycarbonate or composit escutcheon for the face of the radio. Something that was a 1-piece flexable or a 2-piece clamshell escutcheon that would wrap around, and mold to, the front of the radio to protect the knobs on the right side.

Since the radio is reaching the end of it life, I doubt that ever happening but regardless, and all things considered, Yaesu had a winner here. I will rank the 897D with Yaesu's greats; Such as the FT-470, FT-101-series, FT-990, FT-2400 and the FT-ONE. Yes there are more but these were the one's that served me damn well.

Best!

Topic: 27797 Message: 27797

Has anyone installed the INRAD 2.0khz SSB filter in their 857/897? Does it make a big difference on SSB? Does it help on transmitting at all if you put it in line during transmission? I don't do much SSB operating on HF but think a SSB filter would help on 6 meters during the Es seasons.

Date: 2009-09-22 19:23:48 UTC
From: ki6ppw
Topic: 27799 Message: 27799

Greetings,

I purchased my FT-897 a couple of months ago, and the more I'm using it, the more I'm really happy with my selection. It's my first HF rig, and I bought it with emergency communications in mind. I built two boxes that will hold 6, 12V 7Ah gel cell batteries each. Each box will give me 12V 42Ah of power. I used these batteries, as I have ready access to a number of these. I posted some pictures in the photo section, in an album called "Battery Box For FT-897".

Why do you need to increase it? Measure it with a scope and see if it is 1V peak to peak. That would be the standard.

There are gain pots in just about every TNC. I assume you have checked those.

27802. Re: [FT897] External Battery Box For FT-897

Yahoo group: FT897 (2009)
Date: 2009-09-23 22:22:46 UTC
From: Alan Barrow
Topic: 27799 Message: 27802

Another option is to order just the case half for the power supply, which could give you more room for Batteries. But you could easily fit 10-15AH of batteries even in the factory slot if your pockets are feep enough. Pieces parts for the 897 are easy to get and reasonable in cost.

After trying lot's of stuff, I've found that SLA's less than 50AH are not that useful for portable ops, you are better to go with NiMH or Li*. Just too much voltage sag due to internal resistance. I do use 50AH SLA's in a "tall .50" ammo can for weekend ops. But not for anything I have to lug it very far. Just too darn heavy.

The 897/857 was designed for 11 cell strings of NiMH. When you run it on an SLA/AGM you quickly drop below voltage spec when you still have some SLA capacity. Not an issue with NiMH or Li*. It's the right design decision as that's closer to automotive voltages. Other radios (IC-706, etc) have even narrower voltage ranges, so the SLA issue is not unique to the 897.

Some folks use voltage converters, but I find it's cheaper/simpler in the long term just to get the proper batteries. Lighter, works better, etc.

The 817 & IC-703 do work OK with SLA's, but a large part of that is they don't draw enough current to get into issues with the internal resistance.

Have fun,

Alan

> 73s John AA5JG

I have the Inrad 2.0 Khz SSB filter on my Ft-897. It does work, but the difference is not that significant. The stock filter is better for listening, so I only flip to the 2.0 filter when there is adjacent QRM.

I don't use SSB much. It's nice to have the filter, but by no means IMHO a necessity. You get much more bang for the buck with the 500 Hz CW filter, so if funds are tight, I would buy the CW filter before the SSB filter.

I have used the 2.0 filter on PSK, it helps some there to get rid of adjacent signals, but the 500 hz filter really knocks everything out.

You may want to try the w4rt 2.3khz filter, I can hear the difference between the stock ceramic filter and that one on SSB at least on 80m. Although since you dont use SSB that much it may not be worth it to you.

I may have to investigate the 500hz filter for data. I had just been playing with the DSP BPF setting it where I want it to crop out what I dont while doing data.

Any filter that you purchase and install and you spend more that $50 on will be a very large improvement on the Murata filters that are in the radio.

27806. Re:Can audio output to the data port be increased?

Yahoo group: FT897 (2009)
Date: 2009-09-25 16:02:26 UTC
From: Peter, PE1DCD, Rotterdam
Topic: 27783 Message: 27806

Hello to all,

I have to warn you.
The 1200bd- and the 9600bd-output on the DATA-connector of the FT897 is NOT 600 ohm, although the manual says 600 ohm !
I did some meassurements on my FT897 (non D) and also reading the diagram and find out that the output impedance is around 5700 ohm !
It could be that there are some difference with other models (FT897D, FT857 and FT857D).
My diagram is not very clear; it could be that I misread the numbers.

Follow the 1200bd output at the DATA-connector:
Pin 5 --- R1583 (1K) ----- R1568 (4K7) ----- Q1120 So 1K + 4K7= 5K7

And the 9600 bd output at the DATA-connector:
Pin 4 --- R1581 (1K) ----- R1563 (4K7) ----- Q1123 So 1K + 4K7= 5k7

My measurement at the 1200 bd output on 2 meter:
DSP = off
Hf = 10 uV
Output is NOT terminated
Deviation level distorsion
1 Kc 58 mV 1.7%
2 Kc 116 mV 1.28%
3 Kc 171 mV 1.02%
3.5 Kc 200 mV 0.8%
4 Kc 225 mV 0.95%
5 Kc 274 mV 1.74%
6 Kc 325 mV 2.6%

Resume: do not trust the manual always !

Dennis,

The Mic setting you are talking about is function 059 "MIC SEL" and allows the selection of NORmal mic, REMote MH-59A8J or CAT. THere is nothing any more specific.

FWIW, the problem has not shown itself again (yet).

27808. Can't transmit: infinite SWR all bands -- eek

Yahoo group: FT897 (2009)
Date: 2009-09-25 23:50:58 UTC
From: Lew Phelps K6LMP
Topic: 27808 Message: 27808

Something really serious has happened to my FT-897D. I'm posting here to see if there's anything I might b e able to do before I box it up and ship it off to Yaesu.

First thing I noticed was last night, when I tried to tune in an AM broadcast band station to listen to a baseball game. The rig would not demodulate any AM signals on any band (also tried WWV on several bands). I could hear the broadcast by switching to either SSB, and also with the rig in CW and some digital modes, although obviously distorted.

Then, when I tried to transmit, the rig would flash HSWR for just a fraction of a second, then the transmit would shut down completely. This is true for all bands, all modes, including UHF/VHF bands, and even with the transmit power cranked down to 5 watts.

I tried a total system reset (HOME-PWR] but that didn't change anything.

I have tried operating with two different antennas on each of the output jacks, and with a dummy load attached as well. Still the same result with every combination of outputs. I even tried switching mikes between a Yaesu handheld and a Heil boom mike. Nothing works. Uggh.

Has anyone experienced comparable symptoms and been able to fix the problem without a trip to the shop?

Thanks,

Lew K6LMP

27809. Re: Can't transmit: infinite SWR all bands -- eek

Yahoo group: FT897 (2009)
Date: 2009-09-26 03:12:12 UTC
From: W1AEX
Topic: 27808 Message: 27809

One thing I would suggest Lew would be to remove the top and bottom covers and snug up all the mounting screws for the mainboards. These have a tendency to loosen up over time, possibly due to repeated thermal cycles, and can change ground paths within the radio. This can cause all kinds of strange symptoms, including unpredictable receive problems as well as full output oscillations on transmit, regardless of the power setting in the menu. Check the snugness of the fastening screws for the output transistors as well. I ended up putting lockwashers under all the mainboard fasteners because they were creeping out every 6 months or so and that resolved it once and for all.

Hope that is your problem as it is very easy to resolve!

Topic: 27811 Message: 27811

I've just got my FT897, and very impressed I am! However, I notice that when setting up the steps for VHF/UHF FM, operation 052, the step is different to the one shown in the display. To get 12.5 khz spacing I need to enter 5khz (I think). The other thing, and this could be my colour blindness (!) when running on the internal batteries both panel lights come on, and switching batteries seems to make hardly any difference to the colour of the lights. Is it me? (Yes I am a TOG!) Thanks

Has anyone ideas about the Configuration of the Rigblaster Pro to the FT 897D? The initial setup with Digipan works as does the Mic and PTT but when I connect up the leads described I get no results.

I have the audio in and out via the 6 pin DIN socket. I have the RXD, TXD, and GND connections to the CAT Socket. I have tried configuring the P16 jumpers but none of them work. Maybe this is not the way to go about it.

All ideas would be most welcome,

Steve (EI5DD)

Had the same doubt when I started to use my new rig two months ago, I tested from 15 to 50 (menu 81) then added compression (menu 74) at various level (from 50 to 100) then added DSP filtering (menus 46, 47, 48) and it has improved a lot. You just need to test and get reports from other OM. My current settings are 81/50 - 74/100 - 46/280Hz - 47/2130Hz - 48/BOTH and I am happy with them but it all depends on your voice as we are not built egal. 73s FK8IH

One other simple thing to do while you have the covers off is to re-seat all the interconnecting mini-coax connections that run from the top board to the bottom board. If the slide in plugs are not fully seated you can end up with a high resistance connection which can cause all kinds of unpredictable things to happen. Just gently separate them and then re-insert them to assure that a good connection is present.

Good luck!

If you are using the rear connector, you have to configure the rig for USB DIGITAL. Not standard USB.
If this fails then use the front mic connector and trip the rig using the VOX. This method in my opinion works much better.

Mike,

I hope you are using a true PEP Watt meter and not just trying to 'push' the rig's power meter up on SSB. If not, look up the posts regarding measuring SSB power that comes up about every two weeks.

I've had no problems with the stock MH-31 microphone running at 60 on menu No. 081 and the switch on the back of the mic in the number 2 position.

From: n97223
Topic: 27819 Message: 27819

Hey All,

I did a search on this, but came up empty.

I had my FT-897 sent back to the california repair facility for NO output and no power on. Both were fixed, but now when I transmit on 2M, the signal comes out of the HF antenna connection.

Is this a software configuration or is this hard wired?

I really don't want to send it back again....I am not afraid to open the radio or mess with menus.

Thanks for any help you can give.

From: Randy Charles Ford
Topic: 27819 Message: 27820

How much power is coming out of the HF? A duplexer splits the signal between ports, so there is a little leakage between them. The only problem that I've heard is that some autotuners designed to tune with one watt will be activated in some cases. The output is generally well below a watt, but, I believe it's the Z-11, will, in some cases, activate. The only problem that this seems to cause is if you are distracted by the LED on the tuner.

It's also not unusual for some RF to get back into the other port by picking it up via the antenna. Some have reported this causing the low-power LDG tuner to try to tune.

How are you seeing that the output is via the wrong port? Can you measure the power out of each port?

73,
kg4jix - randy.

Randy,

Good point, I did not realize that a small amount of leakage was normal. I am NOT using an autotuner, just a manual tuner with a meter. I use this radio in my shed at my summer camp....I like to keep it simple.

Anyway, I will have to measure the output on the HF side when transmiting VHF(I don't remember what it was), you maybe right that it is very small. Ther is however no output on the VHF side even though the meter on the display showed full power....so maybe what we have here is leakage on the HF side (normal) and Zero out on the VHF side (the real problem) and the power meter on the display is messed up?

As others have indicated, there is nothing in the manual or tech supplements that indicate the ports can be swapped....like the FT-817.

I don't use VHF very often on this radio, ussually on HF, but it is nice to know I can get the the MT Washington repeater (NH) when I want to.

Thanks to all that answered! I will report back.

27824. Possible RF problem solution...

Yahoo group: FT897 (2009)
Date: 2009-09-27 16:13:11 UTC
From: Jeremy Dunman
Topic: 27824 Message: 27824

GE everyone, I keep reading that people are having problems with stray RF getting into their radio causing it to turn off. I started having this problem recently and couldn't figure out what the cause was to save my life. Well I removed my VHF antenna that I had just recently put back on the radio (ironically about the same time the problem started) and low and behold the problem is gone. While this may not be the answer for everyone this is something that worked for me so I thought I would throw the solution I came up with out to everyone else and see if maybe this would help another frustrated FT-897 owner out there.

If this helps anyone else out there or you have a suggestion to help resolve this problem all together please feel free to let me know what you came up with.

27827. FT-897D x FT-897

Yahoo group: FT897 (2009)
Date: 2009-09-27 18:11:15 UTC
From: py1lo
Topic: 27827 Message: 27827

Hi all,

I recently bought a FT-897 (D). How to access memories (M-601 M-605) of the band of 60 m? For the manual, page 23 has no effect, when I press the V / M goes to 7.000.00MHz. How to tell if the TCXO is installed? I wonder because I doubt if it is the D version, because only in the box written is FT-897 (D). The radio not only FT-897.

Thanks
Miguel, PY1LO

Hi Scot, I'm not very well up on aerials but what I say might just strike a bell with you. Firstly I think a G5RV is a 'balanced' antenna and when fed with ladder line the RF tends to balance out, so perhaps that's why you don't have problems with the G5RV. But I'm not sure that operating close to it is too good for you, mainly your eyes I think from what others have said.

Now, the mobile whip does need something to work against. Really it's only half an antenna, and when on the top of a car the actual magnet may not touch the body but the other half of the RF gets through to the body by capacitance so it becomes a full aerial. So you do need some metal underneath it - about a quarter wave. So if it's 6m then you need 1.5m. It can be all around it for omni-direction, or if you stand the mag mount in one corner and it's 1.5m to the other corner then generally the RF will fly off in that direction.

With the mag mount you shouldn't need the 897 earthed, but for HF you do. But that is the problem because you're so far away from the ground. The earth lead from the rig to the ground will be so long it'll resonate in the HF bands so give unexpected side effects - in fact it will be a DC earth, but not an RF earth at all.... Perhaps best to read up about this point on the net, or... dare I say move the rig next to a window on the ground floor? :)

Those are special memories only available in an unmodified US version.

You can manually program the 60m band (be warned the FCC publishes the
carrier frequency which is not what the radio will display since its
USB).

That depends. I published a circuit with 897 pinouts (which was my only addition, credits are on the page where I got it from originally) which connects the DATA jack (ps/2 mouse/keyboard extension cable) and not the CAT port. This will let you control PTT and connect either 9600 or 1200 to your mic, and your speaker to the radio. It works well with several programs I have tried for packet, and if your morse app uses DTR to trigger PTT then it should work with that too.

From: Dave Nelson
Topic: 27819 Message: 27831

Sorry Randy
but that is totally incorrect

The V/UHF and the HF/6m antenna ports are totally separate, there is NO duplexer/splitter or anything like that between the TX power devices and the antenna ports each of the pairs of bands go direct to their respective antenna
ports via appropriate Hi-lo pass filters and diode switching for TX and RX.

Only at low power levels PRIOR to the final devices does the respective HF/6M
2M or 70cm come from the main board via a common coax to the PA board

The Hi-Lo pass filters prior to the PA devices would effectively stop V/UHF from
going through to the HF/6M PA device. and visa versa

there has to be another reason .... mis-identification of ports etc

Dave,

How does a Hi-lo pass filter dividing signals between outputs based on frequency differ from a diplexer? (Sorry, I meant "diplexer" when I typed "duplexer" in my earlier post.) "Effectively stopping the signal" really means to attenuate it to below some threshold. Several people have posted their measurements of up to 0.5W or so of VHF signal coming out of the HF port. Most report lower than that. Some of the people who have done the measurement have used spectrum analyzers to show that it is the modulated VHF signal that is leaking, so it isn't an out-of-band signal. Others have shown that the commonly measured values, generally less than 0.25W, are reasonable.

I'm not sure if the discussions have been mostly in this group or the FT-857 one, but it comes up regularly.

73,
kg4jix - randy.

It doesn't, BUT if you read the post the OP was saying that the paths are entirely seperate! If the filters are not connected together at a common point they cannot be a diplexer.

The TX paths go through different PA stages for HF and V/UHF and then through different filters, and then to different antenna sockets.

How are these measurements being done? Is the HF port terminated or is it still connected to an HF antenna, or is there an external dipelxer attached?

If it is it is likely that the VHF power is being received on the HF antenna and routed back down the coax to the radio. Otherwise it seems very unlikely that these measurements are real.

Look at the circuit diagram and it will become obvious that there are no common high power paths AFTER the respective HF and V/UHF PA's, before you get to the antenna sockets.

This needs further investigation.

I can confirm that it does happen. If I transmit on 2m and have my LDG auto tuner connected to the HF port the LDG sometimes senses RF & starts to tune.

The connectors on the PA board are reasonably close, maybe there is enough coupling between the VHF and HF output stages on the PCB or some components to allow the signal to cross over.

All:

I'd like to associate myself with earlier comments that this RF could easily be coming back in from the opposite antenna. This problem is worse in situations where the antennas are in close proximity to each other, such as mobiles, but can happen even with considerable spacing.

To definitively determine if that is the case, simply connect a dummy load to the port opposite the one you're transmitting on, or to the antenna port of the auto-tuner that's being affected.

If this is the problem, then a low-pass filter for the HF antenna line and a high-pass filter for the VHF/UHF antenna line will certainly solve the problem.

This does happen, and moving antennas has been enough to stop the retuning problem for some people.

> To definitively determine if that is the case, simply connect a dummy
> load to the port opposite the one you're transmitting on, or to the

Several people did this, and confirmed that VHF was on the HF port, even with VHF-rated dummy loads on the VHF port.

> If this is the problem, then a low-pass filter for the HF antenna line
> and a high-pass filter for the VHF/UHF antenna line will certainly solve
> the problem.

It wasn't much of a problem for most people anyway. Some people place their tuner on manual mode. The amount of bleed differs with different radios, so most people don't have any issue at all using the tuner. Since the problem is marginal at best, anything causing loss before the tuner, such as a SWR meter or switch keeps many from seeing the issue. Even using a longer coax before the tuner has stopped it for some. Of course, many just ignore the tuner retuning on HF while they're on VHF anyway.

There has been a lot of discussion of this in the past. I'm going to drop out now before this thread starts to rehash it all again. It's in the archives.

w4rt specifically says this problem occurs when you Tx 2m/70cm on a 897.
Its on the ldg z11pro page, they recommend you get a different tuner
that filters better and doesnt try to tune HF while you are working
2m/70cm.

I really havent paid enough attention to know if this is really the same
thing, and right now I am not in the best state of mind, but I thought
that it might be a helpful tidbit.

Hello,
I'm sure what I've done but the rear cat port won't connect.
I've tried all the settings also a new cable.
I can connect using the front mic plug and that works fine. I've tested that 13 volts comes out of the pin on the rear connector also the surface mount fuse seems to bell out ok.
Is there anything else I could try.

Thanks for any advice.

Mark

kc2dwg:

This seems like an odd statement. Any tuner that auto-senses RF at a level that will catch the power coming back in the HF port will likely try to re-tune. I suppose if it knew that it was power coming from the antenna rather than the radio it could avoid that, or if there was filtering to prevent this, but I don't see those as normal requirements for an HF auto-tuner.

It's really simple to solve this problem, if that's what it is. All it takes is a low-pass filter on the HF antenna line. That can even be a spare diplexer with the VHF/UHF port terminated. It's pretty easy to build one for that matter. I don't see the sense of replacing an auto-tuner for this reason. Of course you want to be sure that your low-pass filter cuts off above 50 MHz if you're going to use 6 Meters.

that is what I was planning on doing. According to various people like w4rt electronics, its because on the 897 (maybe 857) when you Tx on 2m/70cm a little bit of the RF leaks to the HF jack. In my somewhat drugged stupor after coming home from the dentist this morning it all seemed to make perfect sense and be relevant.

I wasnt suggesting that, I was just saying that this is a known problem.

The rear cat port can be used for a linear, tuner or CAT. You have a
menu option somewhere (radio not handy, cant get the number) that will
let you select what that port does.

If that port is anything except CAT it will not allow you to connect. I
also think that there is a remote tuner option somewhere else that
changes that to tuner, but I just dont remember. I would look at what
the port is set to and what bps rate it is (I think that is the menu
item just prior)

27846. Strange RX noise - FT-897D

Yahoo group: FT897 (2009)
Date: 2009-09-28 06:53:55 UTC
From: yo5orw
Topic: 27846 Message: 27846

Hello.
I have a problem with my ft-897D. Few days ago it started to receive some noisy signals on all bands even without antennas connected. The built-in S-meter is fluctuating from S1 to S9 randomly. The noise can be heard on FM when someone transmits on that frequency... that noise makes the receiving unreadable (a strong BZZZZ). SQL does not solves anything (even with max SQL, the signal is still there on the S meter). On SSB and AM the noise can be heard all the time. With RF gain you can cover it if you push it over S10 on the scale.
This is what I tried until now:
- changed the power supply (tried 3 different models, still the same). Also used a car battery and the result is the same.
- went to other locations (different QTHs), far from electrical devices... same thing.
- reset to factory default - still the same.

Here are two movies where you can see more exactly its behavior:

1. http://www.youtube.com/watch?v=DUiAWUD90UM - This is on FM (a local repeater). S-meter fluctuates randomly. When it receives something on that frequency, the noise can be heard.
2. http://www.youtube.com/watch?v=fs6CfluE6e8 - This is on SSB, where the noise can be heard all the time (the squelch must be almost at maximum to cover the noise). The S-meter fluctuates sometimes.

This happens on all the bands and in any modes, even with antennas disconnected.
Right now I'm out of ideas. I cant determine what can cause all this.
I really appreciate any help/idea.
Thank you.

73s,
Cosmin YO5ORW

Hi

I have just got my hands on an Icom SM-10 Compressor/Graphic EQ desktop base mic and I am hoping to use it with the Yaesu FT-897D

This mic is an Electret condenser type mic, and needs 13.8v drive from the connector - the mic has a standard 8 pin Kenwood plug.

Can anyone tell me if this Mic should be good with the 897d?

Or even better, anyone use it with the 897D ?

Also does anyone know where I can buy or order a mic adapter to allow my to use it with the 897D? As mentioned I undertstand the mic needs 13.8V - I am living in London

Kind Regards and 73s, Simon

it depends on the tuner specifically, they are not all the same. Some
require that you change to a carrier mode (am/fm/etc) while others will
internally change the mode, do the tune, and change back.

You should read the documentation that came with your particular tuner
to determine what you should do with that one specifically.

I would take a wild guess and go with common mode transmissions, or some other noise coming in through your power.

Did you connect anything to the radio recently (cat cable, data cable, etc)?

Did you add anything electronic to the house recently?

If the answer is no, its likely that your neighbor did. I could be totally wrong on this, after all its just a wild guess. Standard RFI techniques should help you to locate the source of the noise, and decide how to deal with it.

Thank you for the answer.
The only things connected to the radio are the power supply, which is a Alinco DM-330 MVE, and the VHF 4 elements yagi antenna. I dont own other accessories for this radio yet.
Surely, it became very sensitive to some signals around but it does the same thing in other locations (different QTHs). As a summary, this is what I tried:
1. I changed the power supply (tried 3 different models, still the same). I also used a car battery and the result is the same.
2. I went to other locations (different QTHs), far from electrical devices - no result.
3. I reset to factory default all settings - still the same.
4. I used the headphones (I thought it's a loose wire on the speaker) but the noise is still there and the S-meter still fluctuates.
This behavior is the same without the antenna connected, no matter whats band or the mode.

I tried at home in 3 different rooms, at work (which is at aprox. 20km away from my house - other town) and at a friend (aprox 15km away). My friend also has a FT-897D and does not receives these noises. Regarding the BPL, it is not implemented yet in my country (hopefully will never be). Some BPL tests were made in 2006 but the project was not implemented. Anyway, the tests were made in a town which is far away from mine (about 150 km).

Does this occur without an antenna connected? If it never occurs without an antenna connected it has something to do the antenna connection. It sounds like someone is connecting an antenna to the jack. So it could be a loose connection, wire or something at the RF board. Does it occur with both antenna jacks or just one. This could further isolate the problem to a connector or wire. I assume that you have connected the radio to different antennas with the same results so that rules out the coax or connector.
If you still can't figure it out send a email to Yaesu customer support and see if they have any idea what it could be. The noise the radio makes just remind me of me screwing in my coax and causing a short making the radio make noise similar to what is in your video.

I have the AT-897 and I do not have to put it in any mode. I find the frequency I want and if it is clear, I push the tune button. If the frequency is in use, I move up or down a bit before hitting the tune button and then back to the frequency I want to use.

The only thing I change is the power, I run it down to 5 watts before I hit tune, then back up. I am not sure if this is necessary, but I do not want to damage anything.

I have a manual tuner, so need to choose a mode with a carrier. I tend to use FM at minimum power. You can also use CW. If you enable keying while in a SSB mode (in the menus somewhere) then you can use your Morse key to send a signal to tune with.

If you are using the LDG AT897 like your subject line seems to imply and you have connected all the cables as directed there is no need to make any changes before tuning. When you press the tune button it in essence makes all the changes necessary, keys the radio, tunes, unkeys radio, reverts all settings to exactly what they were before you pressed tune. The details are not reflected on the display as it does this. If you are using anything else that is not so automatic, lower the power to minimum, and tune in AM or CW mode.

DE N7UVL,
Sounds like a lot of methods to isolate the problem has
not gone anywhere, other than "inside the radio".
-Something that occurred to me, although I have not
experienced it myself:
-There have been "posts" on this group concerning
circuit board grounding inside the radio. Tightening
mount screws and such. Also mentioned was placing
"star" washers under the circuit board mount screws.
All to help eliminate "strange" radio noises./ga

Subject: [FT897] Strange RX noise - FT-897D

Hello.
I have a problem with my ft-897D. Few days ago it started to receive some noisy signals on all bands even without antennas connected. The built-in S-meter is fluctuating from S1 to S9 randomly. The noise can be heard on FM when someone transmits on that frequency... that noise makes the receiving unreadable (a strong BZZZZ). SQL does not solves anything (even with max SQL, the signal is still there on the S meter). On SSB and AM the noise can be heard all the time. With RF gain you can cover it if you push it over S10 on the scale.
This is what I tried until now:
- changed the power supply (tried 3 different models, still the same). Also used a car battery and the result is the same.
- went to other locations (different QTHs), far from electrical devices... same thing.
- reset to factory default - still the same.

Here are two movies where you can see more exactly its behavior:

1. http://www.youtube.com/watch?v=DUiAWUD90UM<http://www.youtube.com/watch?v=DUiAWUD90UM>
- This is on FM (a local repeater). S-meter fluctuates randomly. When it receives something on that frequency, the noise can be heard.
2. http://www.youtube.com/watch?v=fs6CfluE6e8<http://www.youtube.com/watch?v=fs6CfluE6e8>
- This is on SSB, where the noise can be heard all the time (the squelch must be almost at maximum to cover the noise). The S-meter fluctuates sometimes.

This happens on all the bands and in any modes, even with antennas disconnected.
Right now I'm out of ideas. I cant determine what can cause all this.
I really appreciate any help/idea.

You must set menu No-001 to "ON" to enable the extended menus.

Cosmin,

I too have a similar problem with my FT897D which I recently purchased used on-line. I will not do that again.

I looked at your video and mine has the same type of noise on all bands with the antenna disconnected and the FT897D has been tested on 2 different power supplies and a battery with the same result. My FT897D is really noisy using AM mode and no antenna. It has reached as high as S9 on occassion and it is a function of temperature. It is less noisy with SSB but that may be a funtion of the ssb filter. If the unit is on a long time it will sometimes disapear. I am convinced the problem is in the radio because none of my other rigs exibit this problem.

I haven't really tried the FM section to see if it behaves like your unit does. I hope we can find the problem as it looks like a nice radio but right now I am disapointed with my recent purchase.

>
> Hello.
> I have a problem with my ft-897D. Few days ago it started to receive some noisy signals on all bands even without antennas connected. The built-in S-meter is fluctuating from S1 to S9 randomly. The noise can be heard on FM when someone transmits on that frequency... that noise makes the receiving unreadable (a strong BZZZZ). SQL does not solves anything (even with max SQL, the signal is still there on the S meter). On SSB and AM the noise can be heard all the time. With RF gain you can cover it if you push it over S10 on the scale.

The 'Y-ACC' cable makes it automatic. I believe LDG supply it as standard now but I didn't get one with mine a few years ago. I bought one recently for £10 (in the region of $10 or €10) or you can make it from scratch or modify a 3.5mm stereo lead - a bit of googling will find the circuit (tip at one end to ring at the other, but I don't remember which way round).

I tried at home in 3 different rooms, at work (which is at aprox. 20km away from my house - other town) and at a friend (aprox 15km away). My friend also has a FT-897D and does not receives these noises. Regarding the BPL, it is not implemented yet in my country (hopefully will never be). Some BPL tests were made in 2006 but the project was not implemented. Anyway, the tests were made in a town which is far away from mine (about 150 km).

Thanks YO9BXC, K3FOD, N7UVL, Keith et al:)

Analyzing all the answers I think there are two possible problems: grounding or a bad filter (or both).
Until the problems started, the radio was operated from the same place (without being moved) for very short periods of time (1-2 hours per day) at maximum 25 Watts on VHF FM&SSB only. I operated this radio for about 3 weeks (without any problem) and then, suddenly this noise appeared. If it is the grounding, shouldn't have had the same behavior from the very beginning?
Anyway, it will go back to the dealer as soon as possible since its in the warranty period. Thank you.

The doco that comes with the AT-897 (at least here in .au) just says 'tune to the desired band, press and hold the tune button until the led lights, then release button to start auto-tune function' - it's not really much help ;)

Though from experience, I can say that it doesn't seem to matter what mode you have selected - I don't know if it's changing the mode, or telling the FT897 that it's tuning or what have you, but even on LSB/USB, the power meter goes up and down as it tunes..

Actually thinking about it, I can't say I've ever tuned on anything but LSB, given I only really use my 897 for APRS :)

Cheers,

The AT897 automatically switches to CW after you push the button, even though it does not show on the radio. It will switch back to whatever mode you had it in after the process.

Just purchased and received a NEW LDG AT-897 plus auto tuner. I installed it as per the instructions and the status LED blinks non-stop. The manual says that, that indicates that the radio is not an FT-897 or FT-897D. But from the badge on the radio is says FT-897 and that is what my manual is for, and that is what I ordered. I have sent LDG an help ticket but was wondering if anyone here has had this issue? Yes I already checked the interface cable and it appears to be good.

Thanks

From what I read elsewhere, when the ATU button is pushed for a fraction of a second, the LED does not light and the AT897 is switched out of circuit.

When the button is pressed for ~1 second or so, the LED lights and the micro in the AT897 communicates with the FT897 and switches the radio to a low power and to a "carrier" mode (AM and 5W I believe). If the SWR is <1.5:1 then the Frequency and L & C parameters are stored in memory and the LED extinguishes and the micro resets the radio to the original mode and power.

If the SWR is >1.5:1 then the micro searches the memory for a set of parameters matching the frequency and tries those for a SWR <1.5:1. If successful the LED is extinguised and the micro resets the radio.

If that search is unsuccessful or the button is pressed for longer than about 2 seconds, the ATU begins a full tuning cycle, seeking a match of better that 1.5:1. When/if that is achived the Frequency and L & C parameters are stored in memory and the LED is extinguished and the micro resets the radio.

At least, this is my understanding of how it works, YMMV.

Geoff

LDG

> Just purchased and received a NEW LDG AT-897 plus auto tuner. I installed it as per the instructions and the status LED blinks non-stop. The manual says that, that indicates that the radio is not an FT-897 or FT-897D. But from the badge on the radio is says FT-897 and that is what my manual is for, and that is what I ordered. I have sent LDG an help ticket but was wondering if anyone here has had this issue? Yes I already checked the interface cable and it appears to be good.

Hi All,

I'm looking for some advice....

I have an FT-897 with the mains supply or batteries. I'm looking to use it at our school to try and get an amateur radio club going with the students. My problem is the choice of aerial!

For safety reasons the windows only open a fraction of an inch. Because it's not an established club (yet) I can't run long wires or install anything permanent on the buildings. I do have a large space in the "loft" above my class which I can get to (with a ladder). I'd like to be able to use anything I get for my own purposes, such as working portable or mobile.

Currently I am looking at the ATAS 120, probably with radial kit, to mount in the "loft" somehow - or maybe on a tripod. If I read things right, it has the advantage that, when matched to an 897, it'll tune itself and I won't have to touch it once I've mounted it somewhere. It also covers 2m and 70cm and won't need an ATU. In the UK that'll set me back about £240 + £90 for the radials. Without the radials I could use it mobile.

The altenative is the Buddipole. No radials, mounts easily on a tripod but it needs an ATU and manual adjustment (so I have to be able to get at the aerial easily). I'd also need to buy a separate antenna for 2m and 70cm; and sort something out for 80m. However, I'm told it will outperform the ATAS because there's "more metal in the sky" and it would be great for portable operation - but not mobile. Then again, in the UK a Buddipole is about £430 (or £240 for the mini if that's an alternative).

What do you think? Or is there an alternative I've missed? All advice greatfully received.

Hi Andy,

First, don't worry about the 2 meter / 70 cm antenna. Since it comes out a separate port on the 897 you need two coax leads anyway. You can make highly effective dipoles for 2m and 70 cm really easily and they are short. Might be a good exercise for the club.

If you really want to save money and don't want to run on a bunch of bands I suggest you look at the hamstick dipole approach.

You can pair 80 and 40 pretty easily, fun project to tune them, easily portable if not mobile.

In the USA we can buy hamstick type antennas for around $20 so the whole 40 / 80 setup will cost around $80 for the hamsticks and maybe another $40 for connectors and such.

Good luck, thanks for helping the younger folks!

It's going to be quite a compromise antenna in any case. And if there is a lot of metal or wiring in the loft space, or in the area of the building around it, that will make everything even worse.

I'm assuming that it's a small loft space. I've seen attic-installed dipoles (bent every which way since there wasn't enough room in the attic) deliver acceptable results. Here's a Web page that talks about one such installation that worked after a fashion: http://www.qsl.net/af4ps/iad.html

Again, I suspect your loft space is tiny - even compared to what that fellow had to work with - if that's so then a dipole may not be an option. However, if it is, you'd find that it would almost certaintly out-perform either of your other choices. They're both severely undersized so you would be adding compromise to compromise to the point where you couldn't expect much.

I'm also assuming you've actually talked to the school administration and know for a fact that you would not be allowed to install a better antenna. For instance, a fan dipole on the roof or even an all-band Butternut vertical on the roof - maybe with the coax coming down to your classroom through the loft area - would be a hugely better choice.

But if none of these options help, then I would get the antenna that you'd most like to have for your use away from school. That way if it turns out to be a complete flop in the loft space you'd at least have one that you can enjoy away from school. I don't mean to be discouraging and it's great that you're doing this. And you may already being going into this with realistic expectations.

Andy,

I own the Ventenna Companies HFp. I bought the vertical kit first and
then the dipole kit to take and use when camping with my motor
home. Both work great. You can buy vertical or dipole
kits. Cheaper and more portable than other antennas.
The only problem is that you have to configure the antenna for
different bands. It is cheap enough that you could purchase two
dipole kits (say for 40 & 80 meters) and install them both in the
loft and use a coax switch at the radio. You can check out the
web site and e-mail the owner with questions. He is great to work with.

http://www.ventenna.com/

You can also check out the reviews on e-ham

http://www.eham.net/reviews/detail/2737

I would try a "fan" dipole first. Very cheap to make and fun to tune. I used one for years. They were short so soldered wire to ends (let them hang down) and cut as needed. A vertical may pickup too much noise.

Maybe not. I had similar notions for my house trailer. I talked to a couple of antenna companies and learned thatANY metalic roof (need not be the car top) will serve. So if your roof has (or you can incorporate) some metal, you might get a servacible antenna.
But even if you are toally successful, it's still a screw driver.

If you are going to have a club, try a hand made skyhook. ARRL had an article about a helically turned verticle. It looks promising to me. Something along those lines (providing you have some metal to work against) can get you on the air.

I'd also need to buy a separate antenna for 2m

The ATAS120 will still need a diplexer for V\UHF operation.

Given that you can open the window a fraction of an inch, if you have trees or other suitable mounting points outside the windows I would consider making up a set of folded dipoles from 300 ohm TV antenna lead. These are cheap, easy to put up and take down, and you would need only enough open space under the window to pass through a coax connector. If things are really, really tight you could construct the antenna so that the pass-through would be 300 ohm twinlead, not coax.

Instructions for making these dipoles are in the ARRL Antenna Book, the first two pages of Chapter 15, "Portable Antennas." They have a chart giving precise cutting instructions and dimensions for all HF bands, using 300 ohm twinlead and either a stub or capacitor at a certain location on the down-lead portion of the twinlead, to match the antenna t0 50 ohms. Email me offline of you don't have access to this book and I will send you the relevant dimensions.

I've made a set of these antennas and they function well. Costs are minimal; you'd need about 400 feet of twinlead (if you make antennas for all bands includng 80 meters. You could start with 20, 15, and 10 meters with as little as 100 feet of twinlead, a handful of coax fittings, and a length of 50 ohm coax with appropriate fittings on both ends.

I did a test. My results are: Patch cord has 3.5mm ends, one red, one black

RED BLACK
1 <-----> 1
2 <-- 2
3 \--> 3

Red 3(tip) and Black 2 (middle ring) doesn't go anywhere

The cord itself is about 10 inches long (25cm)

This came with the LDG Z-11Pro auto tester. I'm guessing they all will work pretty much the same as they have to mate up with the radio.

You dont even have to do that, although I really dont know how well the Comet CTC-50M works not having one, it may be that you can stick this in the window and close it.

reference url:
https://www.hamcity.com/store/pc/viewPrd.asp?idcategory=390&idproduct=1787

Basically its like twinlead (thinner than normal stuff, like what those indoor FM radio dipoles are made from) with 239 connectors on the ends. I plan on making one out of similar TV hookup wire obtained for $1 from frys as soon as my antenna analyzer is returned in working order. I wanted to check it out to see if anything special had to be done for matching and all that and not just slap one together and hope it works fine. It *looks* like its just wire and connectors, the connectors look too small to have a toroid or something else inside, but stranger things have happened.

Could be a nice project for someone who has working tools :)

So long as we're discussing portable antenna alternatives, I think it's useful here.

Pinout for the Y-ACC Cable .

Radio Tuner

Shield ------à Shield

Ring---------à Tip

In case the formatting of the diagram didn□t come out right. On the Radio side the shield is tied to the shield on the Tuner Side. Ring on the radio side is tied to tip on the Tuner side. Tip on the radio side and ring on the tuner side are not used. If you make one and you don□t have different color stereo plugs be sure and mark it to show which ends go where.

Seems so to me too for what it's worth - after all many of us own the 897d because it is portable. So ideas about portable antennas are of interest to a lot of us. Besides, I hope we don't get back into the 'off topic' police stuff again. That got very old. More time was spent discussing whether something was or wasn't on topic than was amusing. That's what mods are for and as long as everyone cheerfully complies when a mod decides enough is enough, seems like a good way to go.

So long as we're discussing portable antenna alternatives, I think
it's useful here.

Mike,

Andy said in his post he would like to be able to use the antenna for
personal use also. Either portable or mobile.

27897. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-10-01 07:39:01 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 27897

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

I too am following this thread with interest, as I wish to eventually do something similar portable with my 897. Reading all the different ops. thoughts is interesting and to me totally on-topic for the 897.

To me, the best idea so far is to get some 300ohm twinlead out of the window to various dipoles in parrallel. And for VHF/UHF a dual band colinear with a counterpoise attached to the window. This could work locals/repeaters and so demonstrate these bands even just in a local sense.

David G4TUP.

I would agree if it is something directly related to the 897, but you might find better experience from key subject matter experts (and there are many) if you target the correct group.

I would not post a question here for my 897, turbo tuner and my HiQ mobile antenna if the antenna would not tune correctly. That is not something fixed in the 897, but more in the area of my mobile installation.

Many of us subscribe to many lists just so that we have access to those that have the best experience for the topic.

However I will defer to the List Moderator.

From: DavidN
Topic: 27881 Message: 27900

How do you know that 'Many of us subscribe to many lists'? Have you done a poll of all subscibers to this group?

I am absolutely certain that as users of the portable 897 that there is an absolute wealth of knowledge and experience within the subscribers to this group with regard to aerials and anything else that gets connected to the 897, as demonstrated many times recently, and so far, by just reading this group I've learnt a lot - thanks guys!

I'd be now interested to hear from Andy, the original poster, on his thoughts about the future of aerial/s at school for his 897.

David G4TUP/9H3CU.

27901. Radio Locking Up

Yahoo group: FT897 (2009)
Date: 2009-10-03 16:08:23 UTC
From: KD8CCX - Adam Filkins
Topic: 27881 Message: 27901

Hello All,
Hopefully someone can help me with this issue, as I have not been able to find anything like it.

My 897 is locking on transmit whenever I use it on a repeater with a PL Tone. It works fine on a repeater with no PL or on Simplex.

I have completed the following to try and resolve the issue:
1. Checked all settings
2. complete factory reset
3. low power xmit
4. switching antennas

I am at a loss. My guess is that this could be a micro processor issue - but I am hoping that is not the issue.

Any help is appreciated. Please let me know if you have any suggestions.

Thanks and 73's

27902. Battery Operation...Verification Please

Yahoo group: FT897 (2009)
Date: 2009-10-03 22:59:09 UTC
From: Larry D. Barr, K5WLF
Topic: 27902 Message: 27902

I'm contemplating getting a pair of FNB-78s for my FT-897D. One thing that's not mentioned in the OpMan for the radio is whether or not you can leave the batteries installed and connected while operating on external 13.8 VDC power.

Perusing the schematic indicates that RL3001 (and its associated components) is the power source selector and automatically selects the external source and disconnects the batteries when the radio is connected to external power.

It'd be mighty inconvenient to not have that feature and I think I've got it figured right, but I'd just like verification before laying out the money. Leaving the batteries permanently installed and connected is SOP, right?

Thanks.

27903. MD-100a8x settings

Yahoo group: FT897 (2009)
Date: 2009-10-03 23:14:50 UTC
From: Hank
Topic: 27903 Message: 27903

I have the FT-897D and just purchased the MD-100a8x. I was wondering if anyone had any suggestions on the settings on the mic as well as menu settings on the radio. I know that every set-up is unique due to the individual qualities of peoples voices, but I am hoping for recommendations for settings to start with. For instance, on the radio, should I use EQ or mic processing? Also, what should I start with on mic gain for SSB and for FM? Right now with the stock mic I am running my mic gain at 85% for both SSB and FM.

Any suggestions are greatly appreciated.

Thanks,

Hank/KB4MTO

> external 13.8 VDC power.

yes you can, however if you cut that power the radio will turn off, this
is the same as the CAT power off from what I can tell. If you turn it
on before you turn your 13.8v power supply on it will run on batteries,
turning the power supply on will then cause it to flip to the 13.8vdc
automagically.

I have used both a computer power supply @ 12v and a astron rs-35a to
power my radio with the internal batters. I have also used the w4rt
charger while running it on 13.8vdc.

27905. Re: [FT897] Battery Operation...Verification Please

Yahoo group: FT897 (2009)
Date: 2009-10-03 23:36:40 UTC
From: Dean Nash
Topic: 27902 Message: 27905

I leave my batteries in and connected all the time. Move the radio from portable, mobile (in the truck) and in the shack as needed. The only issue is when I disconnect the external power source in the shack or truck, the radio shuts down. As long as you are aware that this happens, it's not a problem. The fist time I did it, I was in the middle of an ARES exercise and didn't pay attention. The radio was off for about a minute before I realized it.

As an aside, there's no need to spend the extra money on the battery packs from Yaesu. Go to gigaparts.com and get W4RT's version of the batteries. They are just as good and much cheaper.. The OFC charger is also cheaper than Yaesu and charges the batteries much faster.

Thanks, Bret. I guess that explains what the FET is doing in the circuit.

One question about the W4RT charger. The specs on their website state that it needs 26-28 VDC input. That would seem to restrict it to using only the wall wart transformer and preclude recharging from a vehicle or from PV panels. Is that correct? The Yaesu CD-24 accepts 13.8 VDC which adds a lot of flexibility in charge sources.

Thanks again.

Subject: [FT897] HRD PC - Sound Card

Hi Guys... I am newbie... and sorry about my english...

My question is: Can I use a good PC sound card as an input
for MIC and ext. speakers when my FT-897D is ON? I have
CAT cable hocked up and I would prefer to use PC MIC with HRD.
I am partially disabled person...

Keep well.... Goren.

CAT will only read the radio status and PTT control.

You will need to interface the sound card to the radio via the 6 pin "Data" jack.

This is to get the audio in and out.

Hi Goren, If you are trying to transmit you will need an interface like the Signalink or home brew interface to allow you to operate the rig you are going to use. The cable you have will allow HRD to run and show your rig on the PC, but you have to add the sound card to transmit. Your PC sound card will work if you interface it with the proper cable(s). The other post is correct by steering you to the file links as they will help you through the proceedure.
BTW, where is your call sign?

I am guessing they want you to use 2 13.8v panels to make the 26-28v for
solar. I would agree that its easier to get about 13.8 (+/-10%) than
26-28 unless you have a dual voltage system, and the regulator actually
does 27.6vdc or so.

Well, that makes the decision for the Yaesu CD-24 charger. Although the W4RT batteries are a much better deal, so I'll probably go with them when they're back in stock. I have 2 X 64 watt PV panels mounted on my pickup to charge 200 Ah of 12 volt AGMs to run the radios and such. OCV on the panels is about 17.6, but they're paralleled for amperage and the charge controller is set for the AGMs. Therefore, I want to be able to charge the 897D batteries off the existing PV system.

Thanks.

I have the FT-897D and just purchased the MD-100a8x. I was wondering if anyone had any suggestions on the settings on the mic as well as menu settings on the radio. I know that every set-up is unique due to the individual qualities of peoples voices, but I am hoping for recommendations for settings to start with. For instance, on the radio, should I use EQ or mic processing? Also, what should I start with on mic gain for SSB and for FM? Right now with the stock mic I am running my mic gain at 85% for both SSB and FM.

Any suggestions are greatly appreciated.

Thanks,

Hank/KB4MTO

Hi Florentin,

Thanks for the reply. You confirmed what I thought with the mic gain. Someone said it needs to be set at 85, but that seemed pretty hot for this mic. I set it using the ALC meter, and the meter started moving at 25.

Are you using the EQ in the mic, or do you have it set on THRU?

Thanks again for your reply.

Subject: [FT897] Aerial Advice

Hi All,

I'm looking for some advice....

I have an FT-897 with the mains supply or batteries. I'm looking to use it at our school to try and get an amateur radio club going with the students. My problem is the choice of aerial!

For safety reasons the windows only open a fraction of an inch. Because it's not an established club (yet) I can't run long wires or install anything permanent on the buildings. I do have a large space in the "loft" above my class which I can get to (with a ladder). I'd like to be able to use anything I get for my own purposes, such as working portable or mobile.

Currently I am looking at the ATAS 120, probably with radial kit, to mount in the "loft" somehow - or maybe on a tripod. If I read things right, it has the advantage that, when matched to an 897, it'll tune itself and I won't have to touch it once I've mounted it somewhere. It also covers 2m and 70cm and won't need an ATU. In the UK that'll set me back about £240 + £90 for the radials. Without the radials I could use it mobile.

The altenative is the Buddipole. No radials, mounts easily on a tripod

but it needs an ATU and manual adjustment (so I have to be able to get at the aerial easily). I'd also need to buy a separate antenna for 2m and 70cm; and sort something out for 80m. However, I'm told it will outperform the ATAS because there's "more metal in the sky" and it would be great for portable operation - but not mobile. Then again, in the UK a Buddipole is about £430 (or £240 for the mini if that's an alternative).

What do you think? Or is there an alternative I've missed? All advice greatfully received.

Regards
Andy, G8TQH

I purchased this FT-897D ($800+) last year and used it 2 times. Package also includes 2 internal batteries that were NOT purchased new. These are about $125 each new. They still hold a charge. Also is the Charger/Adapter which cost almost another $200. And lastly, the LDG FT Meter ($50).

The radio itself is in brand new condition with box and manuals & receipt.

$995 shipped.

e-mail me for photos or if you need more info.

NEW MICROPHONE CABLE SPECIFICALLY MADE FOR

YAESU FT-897

YAESU FT-857 AND YAESU FT-817

MH 36 E8J MICROPHONE CABLE

THIS CORD IS LONGER AND NOT AS "STIFF" AS THE ORIGINAL CORD.

IT IS FAR SUPERIOR TO THE ORIGINAL

HAS YOUR STARTED TO CRACK? HAS IT STARTED TO BREAK AT THE POINT NEAR THE TOP OF THE CORD NEAR THE MIC?

TAKES 30 SECS TO HOOK UP ONCE THE 3 SCREWS ON THE MIC ARE LOOSE !!!!

Please write me at wa4zvg@... if you need one

I'll take paypal or a check

From: ad0dx
Topic: 27925 Message: 27925

I'm new to psk31 and still not sure about the correct agc setting.

I have 2 questions.

a) The manual for rtty (page 38) "view the ALC meter; a few 'dots' of ALC indication should be observed. If not, rotate the dial know to adjust the AFSK level for seven to eight dots of indication on the ALC meter"... so which is it, a few dots or 7 or 8 dots of ALC?

Most things I read indicate that ALC indicates you are overdriving the transmitter, which causes splatter and results in a poor signal. But in my experience it seems like I get better quality signal (as reported by the person receiving) when I turn the ALC up to 7 or 8 dots.

b) I'm using the USB Signalink sound card. Is adjusting the tx level on the signalink the same as adjusting the digital gain menu 37? If not, what is the difference?

Thanks,

Ron

I use an LDG AT 897 on my FT-897d and my FR-857 and no problems. I also use the LDG AT200 Pro on the 897D when using it as a base unit.

Make sure you heve the CAT and ACC cables firmly seated in the sockets.

>
> Just purchased and received a NEW LDG AT-897 plus auto tuner. I installed it as per the instructions and the status LED blinks non-stop. The manual says that, that indicates that the radio is not an FT-897 or FT-897D. But from the badge on the radio is says FT-897 and that is what my manual is for, and that is what I ordered. I have sent LDG an help ticket but was wondering if anyone here has had this issue? Yes I already checked the interface cable and it appears to be good.

Topic: 27927 Message: 27927

I use my connected FT-897 to my PC through a cable CAT with interfeice USB.
I already used several programs of CAT as Ham Radiate of it Shows off other, but none of them gets to arm bearer of my FT-897. Will it be that is some configuration that I am not getting to do? If somebody please knows about something it helps me.
Thankful

AHhhhhhhh, that makes SO much sense!! Our last holiday away, I had the 897 (with the AT bolted to the side) mounted face-up against the cargo barrier in the station wagon, and with a bag sitting slightly above it, the tune button was getting tapped when we went over decent bumps.. - the next time the OpenTracker would make the rig transmit, the body control module would go nuts! When I finally figured out why my cruise control kept turning off for ~4 seconds at a time I moved the gear in the back around, and re-tuned (which took all of about half a second), and the problem went away..

> resets the radio.

And that would explain why it appears to not have memories of previously-tuned frequencies - to get the LED to light, you have to hold it in for 2 seconds or so.. - pressing it for a second or so and releasing, makes it look like it tuned, but it only transmits for about a half a second - I figured it was just doing something weird because I hadn't held the tune button in for long enough..

Thankyou!! WIll make using the AT so much easier ;)

Cheers,

DG

There's no place on the radio to mount the clip. It's for mobile use or
for hanging the mic on the bench.

I've come to the conclusion that Yaesu are very ham-centric and almost having a subtle joke by not mentioning the mic.clip in the manual, as they know that every ham will want the clip where they prefer it - fixed to the ham bench, strapped round your leg, yes on the rig itself, hung from the ceiling of your RV etc etc! It really is, as a ham, up to your own preference :)

From: ki4diw
Topic: 27932 Message: 27932

I have an FT-897. When the Blue "Power" button is pushed the radio will come on for 3 seconds then go back off. The radio will NOT power back up until the power source, (it does not matter if it is on batteries or the 100 Factory power supply) is disconnected and reconnected. This ALL that it will do. Any suggestions would be appreciated.

Buddy,

Buddy . . .

The radio will shut down if . . .

1) The SWR is too high

2) The rig is on battery power and they are not fully charged

3) Other conditions (high voltage, shorted cables, no antenna
connected, etc.) exist that tell the radio to protect itself.

Kent, have you had the radio shutdown when the SWR was too high? This is interesting as on my FT897, when there was a dead short (braid touching inner wire) across the N socket (VHF/UHF), it just showed HSWR when I transmitted but didn't shut down....

Perhaps older/newer versions behave differently?

BTW, the dead short doesn't seemed to have harmed the finals.... :)

Dave . . .

Your radio probably saved itself by protecting the finals.

If there is sufficient RF in the shack that it affects several boards and circuits, including the power supply circuit, the radio will indeed shut itself down, just as it does with low battery voltage. It's seeing the same condition regardless of the cause.

Too many new hams think that if an antenna can be matched with an ATU such that the rig is happy, then they're home free. Not so, for two reasons: 1) RF in the shack can do strange and wondrous things to circuit boards, components, controls, and displays; and 2) low to no radiation efficiency from the antenna can turn a 100 watt radio into a QRP rig real quickly.

Too many new HF hams with nothing but VHF/UHF experience think the dynamics are the same regardless of frequency. They soon learn otherwise.

From: notehead12
Topic: 4644 Message: 27938

I want to connect my 897 and my antenna tuner to a copper ground bar recently given to me. The bar is rectangular in shape, about 10" X 3" with two rows of holes going across it. Can I use typical galvanized bolts and wing nuts to connect my ground wires to the copper plate, or do I need something different? Any chance I can push the wire through the hole and just twist it? Thank you in advance , Doug Yaeger, KB1QJK

DE N7UVL,
You might want to consider switching the Tuner in and
out of the Transmission Line path. So it will not interfere
with out of Band Receiving. Put the switch & cables in place
with your existing Tuner to see how receiving is affected
and how you like it. If your existing Tuner has a pass
through feature switch, you already have everything you
need for an initial test. Then you can decide if you want to
go ahead and put the switch & cables in place to do the
same thing with an autotuner. Right of hand, I cannot
think of any autotuners that have a pass through feature./ga

DE N7UVL,
I guess I'd better amplify my remarks below, so you wont
"kill your Tuner or 897.
-There would be to ways to accomplish the remarks below.
One would be with two switches, but you'd have to
remember to switch both.
-The other way would be to make sure you are "Not" using
a switch that grounds the unused ports. Place a "T" connector
on the transmission line side of the Tuner. 1 side to the Tuner;
1 side to a port on the switch; and 1 side to the transmission line.
On the Radio side of the Tuner, place a cable to the other
antenna connector on the switch, and finally a cable from the
switch to the Radio.
-When using the switch on the "Tuner" side position, the
"short" extra cable from the "T" to an ungrounded port on
the switch will just act like a stub, that should only have
a minor effect if any on the transmission through the Tuner.
-Again, do not use a switch that grounds the unused/un-switched
ports. You don't want to put your Tuner output to ground
when its not switched into place.
-Finally, there are electronic switching methods that can
accomplish the same thing. Originally used on vintage rigs
for switching a tuner in and out during key down. Most of
those circuits were usually designed to work with a "keyed"
line from the transmitter though. Some Autotuners may
already have this feature, but needs to be verified./ga

> Hank/KB4MTO
As I think to use MD-100a8x with FT-897D does'not have much sence:
With FT-897D's HF frequecy width in SSB close to 2khz it will make almost NO difference with ANY KIND of mikes.Only worth to replace the standart dinamic capsule inside the MH-31 to electret one.Only this will make proper effect in SSB transmitted audio.
If to install INRAD 2900khz SSB filter-the Radio(897D) becomes "a little IC-756pro3" Then any expensive mikes will begin to work...

1 The AT897 autotuner does have a bypass feature by just pressing the tune button in a certain way.
2 Down to the more basic question. If you are thinking of attempting to use the autotuner to match the antenna to the received frequency for better reception it will NOT work unless you are listening to something within the amateur bands. The only way for an autotuner to match the antenna is with a transmission from your tranceiver. If you are outside the amateur bands either the 897 wont allow the transmission, or if you have modified it fir wideband it is illegal to make that transmission.

Doug,

Bolt it and make sure the connections are tight and clean.
Run a low Inductance and Resistance conductor in as straight a line as possible to a GOOD earth ground.
Twisted connections??? is asking for PROBLEMS.

Leon K5JLR

I want to connect my 897 and my antenna tuner to a copper ground bar recently given to me. The bar is rectangular in shape, about 10" X 3" with two rows of holes going across it. Can I use typical galvanized bolts and wing nuts to connect my ground wires to the copper plate, or do I need something different? Any chance I can push the wire through the hole and just twist it? Thank you in advance , Doug Yaeger, KB1QJK

For the ground from my 897 to my car's body I used UR67 braid,
flattened and of course bolted, but it's only about six inches long.
Methinks something wider for a longer run like yours.

David G4TUP/9H3CU.

Also, if you have to use connectors in the ground lead, use the biggest and best CRIMP connectors appropriate for the size of cable. Do not rely on soldered connectors. If you are using strip conductors for grounding, you can join strips by lap joints, through bolted by three bolts of the same material, e.g. copper.

If you are running any length of ground lead, do not run it parallel and/or in close proximity to other wiring.

I examined a church tower that had received a direct strike. There was a little damage to the top of the external 3" by 1/2" lighning conductor, but otherwise the lightning precautions survived their purpose. The church had been hit several times in the past.

However, since the previous strike, somebody had installed some lights and a power point in the belfry, using screw-barrel steel conduit. The conduit ran inside the stone and brick tower, parallel to and about 2ft from the lightning conductor and formed a closed loop. Whe the tower was hit the screw-barrel was blown completely off the wall!

DO NOT RELY ON CRIMPED connectors unless you use solder with them as well. Otherwise they can corrode, wires can come/be pulled loose which will render the connector useless and eliminate the connection.

Some extra infor: In my superb FT-897D with instaled INRAD 2900khz filter I never use any EQ and processing. Those options are very poor in this radio.Only Mic Gain in SSB and FM.Averige settings abt~40-50% The EQ and PROCC schematic in FT-897D is extremly simple-may be of that reason it works not so good.

Dennis, a properly crimped connector is designed to survive a pull test
which is a significant part of the breaking strain of the wire. Soldered
connectors are more likely to corrode.

Dennis

In fact, a properly crimped connection is usually better than a soldered one.

Soldering often provides a solid point where the solder has wicked up the wire making it stiff and more likely to snap off with any bending movement or long term vibration.

Most commercial installations do rely on crimp rather than solder.

From: zephyrnewyork
Topic: 27954 Message: 27954

Greetings fellow hams,

I want to pick your brains again today :)

1. If you could choose a city apartment rental floor from which to work DX (and local) on all HF ham bands to include 160m (and VHF & UHF), which floor would you choose? This includes operating from indoors, and from a balcony or fire escape. Let's assume for simplicity's sake that any floor you choose has a clear line of sight to the horizon in at least one cardinal direction. (The apartment building isn't surrounded on all sides by taller buildings.)

2. Which floor would be the lowest floor you would consider?

3. Is there such a thing as a floor that's too high for good radiowave propagation? (Let's be reasonable. There is no Tower of Babel Apartment Complex in this city ;)

4. What if you could choose any rooftop from which to operate from time to time? How high would your rooftop be? How many stories?

5. What kind(s) of antennas not permanently installed would you use?

Thanks in advance.

73,
Frank

DE N7UVL,
That was my "smartalecky" answer for today.
-Many things to consider:
-My view is Higher above the terrain is better. Grounds can
be worked out. But height is difficult to overcome without
towers.
-Is roof access allowed? Many roofs these days a "rubber"
roof and access is usually severely limited.
-Mounting/drilling is another problem. If roof access is allowed,
mounting & drilling may be limited or not allowed.
-If the roof has some sort of additional framework above it,
additional permissions may be required to mount anything on it.
-You would think a fire escape ladder to the roof would be
convenient place to mount something. I would speculate
the "fire codes" prevent that.
-If roof access is not viable, fire escape metal; drain pipe metal;
are places to steer clear of to keep the antenna from being
"detuned". Balcony metal could be used as a counter poise
for antennas that use that method. (such as Buddie Sticks).
Frequently though, balconies have something above (such
as an overhang or another balcony) that will require some
method to get the radiating portion of the antenna away
from the building.
-Note some people have placed their counterpoise inside
the apartment. I'm not a fan of that method./ga

From: jcglt
Topic: 27954 Message: 27959

I'm working my FT897D from the 4th (and highest) floor of my building (made of steel reinforced concrete) which is situated near the top of a dominating hill in Noumea (New Caledonia). I have a clear line of sight over 270 degrees. I use mobile monoband Hustler antennas (80-40-20-15 and 10 meters) set at about 45 degrees angle from vertical and facing North to get some distance from wall and overhead ceiling, the around 30 feet of metal balcony railing are used as counterpoise. I have no access to the roof top and a non-stealth antenna would not be well considered here.
During the last two months, with a rather low propagation I got on SSB on 20meter band some 59 reports from western Australia, New Zealand and one 58 from Hawai, to be fair I must say that on the other side they used power amplifiers with beam antennas.
About the future, with my strong space limitations I might consider a MagLoop or a Micro-vert antenna. I will also consider digital (PSK31) operation to try DX.
Best 73s, FK8IH

27960. Cutting off while transmitting

Yahoo group: FT897 (2009)
Date: 2009-10-08 00:10:16 UTC
From: Jeremy Dunman
Topic: 27960 Message: 27960

Hello everyone,

Here is the problem, recently my FT-897 has started cutting off staying off for a second or two or sometimes even longer then cutting back on only while I am transmitting, it does it in all modes - PSK/RTTY/SSB. Thought at first it was RF getting back in to the radio via the CAT cable, removed them and still getting in there. Have a good Common Mode choke on the antenna, have several torroids on there and have torroids on the power supply as well, still cant figure out what is causing it. Any suggestions on what it may be? I am going crazy here.

Jeremy

Gary,
Thanks for the info.

I'm asking because I'm currently hunting for an apartment. Even with roof access, I don't plan on leaving expensive antennas up there for long periods. This is New York City. Stuff left out has a strong tendency to walk away on its own.

I did look at one apartment on the 5th of 5 floors which has roof access. However, it's surrounded on 3 sides by taller buildings and has clear line of sight to the western horizon. If I had a choice of one direction, I'd prefer clear LOS to the east for DX purposes.

If I were to mount an antenna upon the fire escape, I would only do so temporarily, while operating. Afterwards, I'd take everything back indoors. So fire code violations, if any, would not apply.

Why don't you like the indoor counterpoise?

It looks like I'll keep searching for a top floor corner apartment with a balcony or fire escape. I hope to find one that isn't surrounded by taller buildings. Wish me luck.

73,
Frank

From: Steve Yates
Topic: 27960 Message: 27963

Jeremy,

Many things to consider. I'll ask a few things that may help someone answer:

1. What are you using for a power supply?

2. What is the supply voltage when the radio cuts off?

3. Does the problem occur when transmitting into a dummy load?

4. Does the problem occur when the RF power output is turned way down?

5. Does it occur when only the microphone, DC power, and antenna are connected?

73,
Steve - AA5TB

27964. CT-62?

Yes, I have one of those that I purchased back in 2006. It uses a Prolific PL-2303 serial chip. The nice thing is that there is good software support for that chip and you can get both 32-bit and 64-bit drivers for Windows XP, Vista and Windows 7 as well as Linux (source code available).

Jerry,

Have you checked the integrity of the DC molex plug. I had a similar problem w/ my Icom 746pro which uses the same plug. The plug was ill fitting and very loose. Intermittently on TX the rig would shut off. I would have to hit the power button again to turn it on. I realized it was the plug and tightened up the prongs. I'll eventual replace it but the problem is gone for now.

Bob

27968. Need Bottom Cover for FT897

Yahoo group: FT897 (2009)
Date: 2009-10-07 04:32:00 UTC
From: DennisR
Topic: 27968 Message: 27968

I have an FT897 with the Installed FT30P Power Supply. I am trying to locate an original bottom cover so that I can remove the FT30P Power Supply and replace with the two Battery Packs. Not having ever seen one, do I need anything more than the bottom cover? I can buy the accessory battery packs, but haven't found the bottom cover as an accessory.

27969. Suggestions requested

Yahoo group: FT897 (2009)
Date: 2009-10-09 19:38:33 UTC
From: w3bi2
Topic: 27969 Message: 27969

Rick, W3BI here...I just purchased an 897d for a trip to Iceland next September. I plan on a CW only operation and only after the days activities as this is a vacation trip.

My request for suggestions is about the power supply. I don't know whether to get the internal power supply and run it off of the 220-240VAC (which it is rated for) or go with 1 battery or 2 with a charger that will run off of the Iceland voltage.

Does anyone know the approximate time, using CW, that one battery will last? Two batteries might add just a bit too much weight as I plan on carrying it in a carry on bag and at 72 it doesn't take too much to drag me down.

I have an LDG Z-100plus to use. Is there an outlet on the 897 that I can use to power the tuner?

Thanks, 73,

Rick W3BI

Take advantage of the W4RT Electronics Columbus Day Special which is free shipping within the USA for orders totally over $100.

www.w4rt.com

To obtain FREE SHIPPING, simply input "Columbus Day" in the Comments Box on the order form. You will still see the shipping charge, but Ralph N5DOI will delete this charge when he processes the order.

Call Yaseu. They can be had. All you need is the bottom cover. Remove the power supply, install the bottom cover and you are done.

Output power will be lower using the internal batteries.

>

You may be able to tap the voltage at the feed point. If this is going to be a common setup option, you may want to construct a molex tap of some sort to enable a power supply for the LDG. Perhaps a simple distribution box with anderson power pole connectors or 5-way binding posts, to enable other options too.

Now, I must deal with my envy of your vacation plans. Best of times for you!

27974. Re: [FT897] Suggestions requested

Yahoo group: FT897 (2009)
Date: 2009-10-10 00:06:20 UTC
From: Gary Altig
Topic: 27969 Message: 27974

DE N7UVL,
Something I have not seen suggested on this Group yet:
Since several people seem to want to "backpack" the 897
and use internal batteries (opting out of the internal AC
supply), there is another option:
-While on internal batteries, output power is automatically
lowered.
-However, regardless as to whether an AC internal supply
is installed, the external 12VDC power source remains
available for use (without lowering the output power).
Even though the 897 is a bit heavy for backpacking,
neither power source needs to be internally installed,
and full power output can still be accomplished by using
a "hefty" 12VDC (13.8V) external power source.
This would "lighten" the 897 for traveling, and place the
emphasis on 12VDC power availability at the travel destination.
-In the case of installing the Internal AC Supply set at
220VAC, the 12 Volt external operation option still is
viable./ga

Hmmm At the bottom of most messages is row of links:
Messages | Files | Photos | Links | Database | Polls | Calendar
^^^^^
Click on Files, then look for RK3BU as a link. That should take you to a
single link to a image file (JPG) That's the link you need to view the
image. Most browsers will display jpgs without external help.

The %20 is a space in the file name.

The file may have been uploaded as a BMP but stored as a jpg (smaller)
file.

Subject: [FT897] Need Bottom Cover for FT897

I have an FT897 with the Installed FT30P Power Supply. I am trying to locate an original bottom cover so that I can remove the FT30P Power Supply and replace with the two Battery Packs. Not having ever seen one, do I need anything more than the bottom cover? I can buy the accessory battery packs, but haven't found the bottom cover as an accessory.

To avoid people posting links to downloaded files, Yahoo! changes the
link every few hours (or at least they used to), in which case it is
FUTILE to post a link.

Yahoo wants customers to NAVIGATE to the files section, and thereby view
the ads in the navigation process. When you go direct you avoid the
ads. Nice idea (and I agree with the thought), but against Yahoo!
purpose of making money from ads.

With Firefox I use ADBLOCK PLUS to stop ads. It works very well and you can
manually block ads, animation, scripts etc that get through the filter.
Pages load a lot faster.....

27983. RE: [FT897] Re: Cutting off while transmitting

Yahoo group: FT897 (2009)
Date: 2009-10-13 03:12:44 UTC
From: Jeremy Dunman
Topic: 27960 Message: 27983

The problem was even more simple than I thought, the power cable going into the back of the radio had come loose from constant portable/mobile operations so tightened up the ends and has been working fine ever since. Thanks for the suggestions on fixing it.

Subject: [FT897] Re: Cutting off while transmitting

Jeremy,

Many things to consider. I'll ask a few things that may help someone answer:

1. What are you using for a power supply?

2. What is the supply voltage when the radio cuts off?

3. Does the problem occur when transmitting into a dummy load?

4. Does the problem occur when the RF power output is turned way down?

5. Does it occur when only the microphone, DC power, and antenna are connected?

Bob,

That's what the problem was. Got this message after I fixed the problem. Apparently the mobile ops and portable ops have taken their toll on the plug so going to have to replace it soon but fixed it for now.. Thanks for the assistance!

Jerry,

Have you checked the integrity of the DC molex plug. I had a similar problem w/ my Icom 746pro which uses the same plug. The plug was ill fitting and very loose. Intermittently on TX the rig would shut off. I would have to hit the power button again to turn it on. I realized it was the plug and tightened up the prongs. I'll eventual replace it but the problem is gone for now.

Bob

27985. Reverse polarity damage?

Yahoo group: FT897 (2009)
Date: 2009-10-13 07:15:03 UTC
From: Geert Jan de Groot
Topic: 27985 Message: 27985

Has anyone ever had the misfortune to try and experiment what happens
if you reverse-polarize the radio? What broke?

Thanks,

Geert Jan
(bought a fixer-upper and worried that's what caused the damage)

27986. Re: [FT897] Reverse polarity damage?

Yahoo group: FT897 (2009)
Date: 2009-10-13 11:18:18 UTC
From: Michael Walker
Topic: 27985 Message: 27986

Usually the fuse in the power cord will blow as there is a reverse current diode inside the radio.

If that isn't the problem, then look inside for a blown inline diode in the power circuit.

If that isn't the problem, it now gets expensive. I have not looked at the service manual (which you are going to need), but the finals are usually no protected by much. Those might have shorted.

Did the owner say what happened?

Press F for less than 0.5 second (ie dont hold it, just tap it)
turn to menu MFn
you should see CFIL for 'A'

'B' lets you activate the filter in slot 1, 'C' lets you activate the
filter in slot 2.

'A' should be apparent as the internal ceramic filter.

27991. AT-897 menu settings.

Yahoo group: FT897 (2009)
Date: 2009-10-14 12:32:41 UTC
From: ringmaster452000
Topic: 27991 Message: 27991

Hello all, I have had my 897-D for about 5 years, and I really love this rig. I just recently added a AT-897 to it and I am having trouble getting it to work. I am hoping that it is just a menu setting or something simple like that. I got the tuner used and I am hoping that I am just missing a small bit. I have the menu #20 set to CAT and menu #85 in the OFF position. Any Ideas??? Thanks for the help. Cheers, Bob kc0kbp

27992. Re: AT-897 menu settings.

I had initially responded to say that the menu should be set to TUN but after looking at the manual: http://www.ldgelectronics.com/assets/manuals/AT-897PlusManual.pdf , I see that you have it correct. I did notice that it requires a 9600 baud rate. If you already have the baud rate set to 9600 in menu #19, I'd try turning menu #85 OFF/TUNER/ATAS to tuner and see what happens.

If the connecting cable goes to the CAT port (on the back side of the
radio) then it seems the radio should be set to tuner.
Menu item 85 sounds right.

I don't have this particular setup but that's how it looks to me (from the
balcony)

The menu settings on the 897 make no difference to the tuner. It only uses the CAT jack to power the circuitry in the tuner. Did you receive the small 1/8" phone plug jumper with your tuner? That has to be plugged in from the ACC jack on the radio to the mating jack on the tuner. If you have this cable, it should be marked, with one end marked "radio", and the other marked "tuner". Be sure to observe these markings. The two ends of the cable are wired differently, and therefore won't work if incorrectly installed.

No problem Bob. One thing you might check is to make sure the CAT cable is seating correctly on the radio end. The CAT receptacle is recessed, and isn't excessively large. Some folks (me included) have had to "shave" some of the trim on the CAT cable to make it's diameter small enough to fit in the trim of the radio receptacle.

Good Luck.

Take the rubber ring off the knob. Underneath you will find a small hole where the set screw is. You can use an Allen Key to tighten. I believe it is a very small metric size.

From: Josh Smith
Topic: 28003 Message: 28003

Everyone,
I know this is slightly (mostly??) off topic but I am in the market for a USB to RS-232 adapter for use with my radios (ft-897d and th-d7ag). My main requirement be that it works with Linux. Can any of you make a recommendation?

Thanks,
Josh Smith

Any device that uses the Prolific PL-2303 serial chip. There is Linux driver source code available for that chip. I have a USB to CAT cable that has the PL-2303 integrated into the cable. Has drivers available for XP, Vista and Windows 7 in both 32-bit and 64-bit flavor (plus the Linux ones mentioned).

28006. AGC "OFF" muting signals ?

Yahoo group: FT897 (2009)
Date: 2009-10-17 05:34:59 UTC
From: dk5ew
Topic: 28006 Message: 28006

Hi group,
I'm doing with my FT-897D WSJT on 144MHz in JT65b mode EME moon bouncing. As recommended I switched off the AGC.
What I determined is that with AGC off the signals is very muted.
Is that normal ? Or is it a particularity of the 897D.
I didn't noticed that effect on my IC-7400 I had.

From: markwilliamlee
Topic: 27991 Message: 28008

Hello Bob,
I expect you know that you have to hold the button in for a while before it will tune.
Just thought I'd mention it just it case.
Also you can also check that there is power on the cat port by poking in a small piece of wire into the hole and measuring with a meter.
There is a fuse inside that can't blow.

Mark
G0LXV

> Hello all, I have had my 897-D for about 5 years, and I really love this rig. I just recently added a AT-897 to it and I am having trouble getting it to work. I am hoping that it is just a menu setting or something simple like that. I got the tuner used and I am hoping that I am just missing a small bit. I have the menu #20 set to CAT and menu #85 in the OFF position. Any Ideas??? Thanks for the help. Cheers, Bob kc0kbp

Hi Siegfried,
reading the stuff on page 25 I don't see something they wrote about muting on 144MHz when AGC is off.

On page 24 they write something about the AGC but also not related to 144MHz.

I read something about IPO function but this is HF related.
Is it possible you explain what you found out or understand according my question ?

Thank you very much !

I have been using the FTDI series of USB serial adaptors with great success
on Win, Linux and Mac for several years. With prolific at high speeds or
extended periods of use it became unstable or unusable. FTDI supports the
Mac, Linux & win systems 100%.
http://www.ftdichip.com/
http://www.ftdichip.com/Drivers/VCP.htm

I can use the FTDI USB adaptors 100 % at 115k with no problems.

28016. Re: VFO knob loose?

Yahoo group: FT897 (2009)
Date: 2009-10-18 06:46:06 UTC
From: MarkL
Topic: 27991 Message: 28016

Matt,

Yes, I have had this condition happen. My experience was when I took the FT-897 up on a camping trip this past summer and had it in the top box of my Goldwing. Seems the Honda isn't as smooth as once believed. There is a spring behind the tuning knob that applies tension to the tuning shaft and knob. Sometimes it will "slip" and lose tension.

You will have to take off the tuning knob to adjust this tension spring. As the other replier to your initial query mentioned you do have to take off the outer rubber ring to access the tuning knob's set screws. However, the knob's set screws are TORX screws and can be loosened with a TORX T-6 tool. Once you remove the knob adjust the tension spring on the tuning shaft to remove the slop in the shaft.

Return the knob back to the tuning shaft & the rubber ring back to the shaft and you should be back in business.

Regards,
Mark (NM7L)

28021. Wtd FP-70 AC Supply, Trd FNB-78 Battery. Internal Ant Tuner?

Yahoo group: FT897 (2009)
Date: 2009-10-16 13:41:59 UTC
From: spike.dennis
Topic: 27991 Message: 28021

I have decided that the FT-897 is not quite the portable radio that Yaesu professes. So, I think I'll convert one of mine to more a portable 'station' radio buy installing a power supply in it. I'll have an extra FNB-78 battery. to trade towards a FP-30 AC power supply

Has anybody installed an internal auto-tuner into their FT-897? I wonder which ones might fit &/or the best choice for such project? I have an LDG-897 on one of my radios but the cabinet is a bit cheesy & fragile, and adds quite a bit of bulk to the project. I've not checked but it looks like the LDG-897 board is too long to try & fit inside the 897?

This is my second attempt at posting this message. I hope it goes threw this time.

Please reply off list via direct email regard any available accessories.

Thanks

28025. Wanted FP-30 power supply, Trade FNB-78 battery. Internal Antenna Tuner?

Yahoo group: FT897 (2009)
Date: 2009-10-15 13:48:05 UTC
From: spike.dennis
Topic: 28025 Message: 28025

I have decided that the FT-897 is not the portable radio that was advertised. As such I'd like to convert it to more a transportable station. In that light I have no need for the internal battery, but do need the a power supply.

Anybody interested in a trade please contact me off list at:
spike.dennis@...

Has anyone done a nice installation of an antenna tuner inside the FT-897? How did it work? What tuner did you use? I currently have an LDG-897 tuner mounted to one of my 897's but that adds quite a bit of bulk to the radio & the LDG tuner is a bit fragile & has a rather cheesy looking cabinet.

From: Domaci
Topic: 1360 Message: 28030

Hi Guys...

What is a best way to hook up classic dynamic Mic to Ft-897D...
My Mic is mono and it has 5 mm end connector.. and it is
a concert quality Mic. I know how to use a solder gun...

thank you...
OM3TLP Peter L.

From: spike.dennis
Topic: 27991 Message: 28031

My VFO knob fell off when removing it from the box when I first purchased it. You can remove the rubber non-skid around the outside edge & tighten the set screw.

28032. Main Dial Problem

Yahoo group: FT897 (2009)
Date: 2009-10-18 02:33:50 UTC
From: stan.leeson
Topic: 28032 Message: 28032

My FT897-D developed and interesting problem, and I want to see if others have experience this. Yesterday, the tuning and menu selection with the main dial was twitchy. Sometimes it would work and sometimes it would not. Today, while I was working some DX, it just quit working completely. Everything else seems to work, but the main dial has no effect. The good news is that it is only three months old and should be under warranty. Has anyone seen this sort of problem, and what was the resolution of the problem?

28033. Getting bad audio reports with Heil Proset Plus

Yahoo group: FT897 (2009)
Date: 2009-10-13 20:09:24 UTC
From: Bill All
Topic: 22 Message: 28033

I recently purchased the FT-897 and a Heil Proset Plus Headset/microphone with the 2 position switch Full Range/ DX on the mike boom. Right away I started getting reports that my audio was not "bassy" enough. The stock Yaesu mike MH-31 sounded a lot better on position 2. I have not turned the audio compression on and have reduced the audio gain menu from 50 (default) to 30 and have verified the Heli switch is on Full Range, but people still tell me the stock mike sounds better than the Heil. Did I get a bad Heil set or is there a setting somewhere in the 897 menu that I haven't found yet?

Your thoughts?

Bill - N3KKM

I have the mh-59 mic and I like the fact that I can control the radio
from it. I also like how it works as a morse keyer (when set on the
radio you can use the top two up/down buttons for dit/dah). So it
depends on what you want.

Mine the numbers are backlit but the "black" buttons (and the one orange
round one) are not backlit.

Whether or not its worth the $80 is something only you can answer.

Hi John,

this one comes up regularly. Turn menu 001 to ON and all the others will
be available. It comes set to OFF as standard which hides many of the less
often needed menus so that you can scroll through the more often used menus
more quickly.

F5U109 is the correct Belkin part number. However, they do not have Linux drivers. Also, the drivers that come on the CD and that are on the Belkin website are garbage. They will cause random blue screen's on XP (can't vouch for Vista). You have to get the latest drivers from the Magic Control Technology web site (the makers of the serial chip that is inside the Belkin device). The URL is http://www.mct.com.tw/web_c/html/technology_2.asp?ParentCID=0001 and you need the U232-P9 drivers.

28044. Re: [FT897] Optional Mic MH-59A8J

Yahoo group: FT897 (2009)
Date: 2009-10-19 10:06:29 UTC
From: DavidN
Topic: 28023 Message: 28044

I got the mic from Hong Kong for £40 including postage and virtually everyone I have a QSO with, without prompting, mentions the quality of the audio, both on SSB and FM. I am really amazed that so many mention the good audio.

I turned the SSB mic gain down to 10, the FM mic gain up to 85, and the speech processor up to 65, which I always have on when using SSB. I didn't need to alter the audio high/low pass filters in the menu.

Yes, it is a pity that Yaesu do not include a DTMF mic with the 897, that's why I bought the MH59 and I didn't want to pay so much money for just a mic., but as you can see it was worth it even just for putting out clean audio (and there's all those buttons to play with too :)).

From: nightmare20_79
Topic: 28046 Message: 28046

Hey guys i am having a problem with my s-meter i had the radio unplugged for a bout a week while i was constructing my tower, got that all done hooked the radio back up and now my s-meter doesn't show any bars or very few where there should be full scale or very close to it. I'm getting great signals and good reports from people the s-meter just isn't showing this i know from the past that the repeaters that I'm talking on had either full or close to full scale on the s-meter. I have checked the coax and antenna with a antenna analyzer and am getting a 1.2 to a 1.3 SWR on 2 meter and 1.3to 1.4 on 440. I'm receiving and transmitting great its just not reflecting that on my s-meter, i even tried a hard reset and its still not working correctly is there a button i pushed or has anyone else had this problem and could help me. I'm scratching my head on this because it was working fine before it just seems like a setting, or i pushed a wrong button. Any help would be appreciated!

I just added a message with the same symptoms. I have reset the memories and I can guarantee that the lock is not on. Shortly before the main dial VFO quit working, you would have to turn it several times as far as normal. Then it just quit working altogether. I will be glad to track the results that you get too. 73s - KD0IDQ.

From: nnvpears
Topic: 13066 Message: 28049

I wish I had known about this sooner, but I only went looking for information after the knob of my 897 fell off. Does anyone have some advice for how to remove the rubber from the knob and what tool I should use for adjusting the grub screw? I am kind of new at this and appreciate any help I can get.

73
KB1QHX
Nathaniel

Hi I fell foul of this as well and you might find if the knob if it
starts to get loose will eventually fall off (be warned if you carry
the radio by the handle and not in a case).
Yes there is a grub screw requiring a hex spanner under the rubber.

Seems that the filter which causes this problem is CF1005 ceramic filter ALFYM455H=K.
Anyone knows if this filter is always active? Can be disabled/enabled? Is it for all the bands/modes or only for particular ones?
Thank you.

28052. Re: Main Dial Problem

Yahoo group: FT897 (2009)
Date: 2009-10-19 14:15:50 UTC
From: stan.leeson
Topic: 28032 Message: 28052

Thanks for the suggestion, but I checked the lock, and I have performed a power-on reset. Also, the day before it quit working it was requiring about 5 times as much movement of the dial as usual to make frequency changes. It was like it was "slipping". Now, it will sometimes change the last frequency digit by one and then the value goes right back. I think it is either some sort of mechanical connection problem or the encoder has died. Either way, I don't know how to fix it. After you remover the rubber cover on the knob, how do you loosen the set screw to remove the knob. I have read suggestions that it takes a 2-mm allen wrench, but it does not look like a hex opening to me.

Sounds like the encoder has gone. My 897D had similar symptons a few months after I got it new. Luckily it was still in warranty at that point.

From: Steve Yates
Topic: 28046 Message: 28054

Make sure the RF Gain is fully clockwise. On FM it will lower the S-meter reading. Also, check Menu 060. It should be set to SIG.

Hello friend, I can be wrong, but when that happened here with me I without noticing turned off AGC, it was with the same symptoms described by you.
Press function (F), rotate MEM/VFO/CH, until appearing in the display NB AGC AUTO, AGC is verified it is activated, it is not activated him/it and everything should return to the normal.
I wait to have helped.

Bill,

I have the same set up as you do. the following settings were what I was given by someone on this group. They are;
Menu #45 change to 120
Menu #46 change to 400
Menu #47 change to 2450
Menu #48 change to BOTH
Menu #49 change to 10, menu letter "P" - DNR (Digital Noise Reduction) on the front panel, change also
Menu #51 change to 45
Menu #63 change to 50, menu letter "L" - NB (Noise Blanker) on the front panel, change also
Menu #74 change to 75, menu letter "C" - PRO (Processor) on the front panel, change also
Menu #81 change to 60

Mic element switch set to Full Range..

Good luck,

Cliff,
N6CTW

Hi Bill !
In SSB both-in LSB and in USB ONLY the menu ¹ 15-¹18 are defininng the "bassy" sound on reseption mode as well as in transmition mode.LSB-R means reseption;LSB-T transmition.USB-R and USB-T are similar.All we have to do to set one of the chosen menues and rotate main dial knob TO LOCATE 455KHZ oscilator freq in ratio to the width of ceramic filter(+-300hz) Unfortunatly the stock ceramic filter is not so wide(2.3khz only)
The best desision is to use INRAD 2900khz filter to be iserted in spare slot-only here it is possible to reach something close to HI-FI SSB, what I did with my FT-897D

28060. Re: Getting bad audio reports with Heil Proset Plus

Bill

What you are experiencing is perfectly normal. The DX position on the mic produces high frequency audio, not bassy audio. The criticisms that you are getting are what you should expect from guys who think audio should sound like "Studio Quality". They are Broadcaster wannabes.

If you are a DXer, leave the switch right where it is. You will get the audio punch necessary to make those long haul or pileup busting QSOs.

If you want bassy audio, move the switch to the rag chew position.

I have the same headset and same radio and also an FT-920. Mine is set for DX audio. I don't rag chew and if I want Broadcast quality in my ears I tune to 95.3 WOLZ oldies.

>

It's not the microphone, but the radio that gets adjusted.

From the manual:

Before connecting the MH-59A8J, you must instruct the FT-
897D’s microprocessor that the MH-59A8J is being used,
using the Menu Mode:
1. Press and hold in the [F] key for one second to activate
the Menu Mode.
2. Rotate the MEM/VFO CH knob to recall Menu Mode
No-001 [EXT MENU], then rotate the DIAL to change
the setting to “ON” to enable the extended Menu Mode.
3. Rotate the MEM/VFO CH knob to recall Menu Mode
No-059 [MIC SEL]. The default setting for this Menu is
“NOR.” Rotate the DIAL to change the setting to “RMT.”
4. Press and hold in the [F] key for one second to save the
new setting and exit to normal operation.

The key is menu item 059. Get the correct selection for the microphone

I think the filter is always active on FM but of course if you fit a Collins ceramic filter frm Yaesu or Inrad you can witch to that and the existing filter is bypassed. That would enable you to eliminate the filter as a problem. But maybe the problem is noisy switching diodes around the flter?

[sent this 2 days ago but didn't see any response, nor did I see
it back on the archives. If it's a duplicate, apologies]

Picked up an 897 cheaply recently. Turns out the 2K2975 driver FETs
are shot. These are on the mail board, not on the PA board.

Unfortunately, thse things are SMD and have a heavy block soldered
on the bottom of the main PC board to take off heat.
Because of this, I have been unable to unsolder them from the board
using hot air because the cooling block on the back just does
it's job too well.

Has somebody done this, and how have you done it?

Try a soldering iron of the needed size and copper solder wick.

Use quite a bit of flux also. Always works for me.

From wb2yok Bernie,

I use an LDG AT-200 Pro with a G5RV laying on my roof and it works very well
with my 897D and my Kenwood 450.
I have an FT 857D inthe car with an ATAS 120 antenna. That works well in the
car.

Change menu item 001 from off to on - this turns on the missing menu items.

DE N7UVL,
There are a lot of differing opinions as to how to power the
FT-897. My own opinion is the FT-897 is limited when using
internal batteries and its weight & size are more conducive
to fixed portable operation. Therefore, I find using its own
FP-30 AC power supply to be ideal in that a sufficient
12 volt DC (13.8V) external source will let you operate the
FT-897 to its fullest potential. (Internal battery use
automatically limits output power).
-For an external 12VDC (13.8V) source, I would go with one
of the Astron Metered (adjustable) 30 Amp (plus) power supplies
if you need something that works off AC besides an internal
supply. For full power operation, other than a power supply
whether external or internal, the 27Amp (full power) draw of
the FT-897 will have to be met for any design.
-If the desire is additional portability, re-consider the
FT-857./ga

Subject: [FT897] 2nd Try

I posted a question this morning and it never made it to the board, I don't know if I did something wrong, so I'll try again.
I'm buying an FT-897D and I wanted recommendations on a good power supply to get. I would like one that I can grow with. Any help would be appreciated.

Thanks

Jethro

I was considering installing an LDG z11 pro. To do this I would have to removed the Z11 from its box. It would have been a very neat solution as you can use the two blanking plugs for the RF sockets.
In the end I built and installed a stand alone AFSK ocillator in the compartment for RTTY work. When I go portable I just sit the Z11 on top of the 897 powered from the +13.8v output.

Car battery with distribution box

BTW you don't get your own messages (at least I don't) I did see your message posted around noon.

I know my car batt reply isn't very elegant and prolly not what you're looking for. QST has printed a couple of articles comparing various power supplies. But all of them were of good quality and if sized right should serve you very well. If you have a healthy wallet, then you have no problems. If, however, you need to watch the hobby budget, then the car batt suggestion will work too.

Are you have any particular problems? Any special equipment?

I know the car battery can sustain operations for hours of Tx. We did it for our local Applefest last year with no problems.

You should get all messages, including your own. The first message you post is delayed until a moderator approves it. Yahoo goes through periods where they grab some messages as spam and hold them for a while before a moderator can see them and mark them as not spam. There doesn't seem to be any rhyme or reason about when they do that, how long they hold it, or which messages they choose to hold.

73,
kg4jix - randy.

I have never seen my posts. I have seen replies to my posts. So I figured
they didn't send my own writings back to their greatest fan.

This one, for example. I didn't see my orignial, but your reply to it is
of course right before me. Maybe I checked off something I shouldn't have.
Prolly cuts down on the traffic. I do keep a copy of everything I post
here and elsewhere.

28079. MDS messures on my FT-897D

Yahoo group: FT897 (2009)
Date: 2009-10-22 12:19:14 UTC
From: Pedro Correia
Topic: 28079 Message: 28079

Hi,

I did an MDS messure on my FT-897D. I have the 2.3 KHz and 500 Hz filter installed, so my goal was to do some comparations. Does anyone have this values for others FT-897D? Looking at the table, and in therms off the MDS, does the investment in filters compensate relativly to the use of the DSP?

Anyway, every amatuer radio I know says that the FT-897D is not sensitive, this table certanly contradicts that! Due to the mesure equipment 1dBm plus or minus is not relevant.

Thanks for the data Pedro!

Mine is certainly sensitive. I usually have the IPO on (Preamp off) or even the attenuator on depending on what band I'm on. I have found that the DSP filters alone work well if you keep the RF Gain control tuned back so that adjacent signals don't pump the AGC. I have the 250 Hz Collins filter and it works very well if you depend a lot on the AGC.

From: Joe
Topic: 28084 Message: 28084

I have at least 8 YahooGroups that I don't receive my own messages. I am even owner of a couple!

Yahoo has never been able to tell me why that is. User PREFERENCES are all the same in all my subscribed groups.

My suggestion if one believes his/her post has not been received by the group, is to go to the group's page at www.YahooGroups.com and see if the post is in MESSAGES. Make sure you wait for 30 minutes, give or take, to see if your message has been posted.

You fit that inside the radio per the original question?

> I have an FT 857D inthe car with an ATAS 120 antenna.

I didn't ask about the ATAS but now that you have mentioned it. I had one, it lasted 1/2 of a 400 mile hamfest trip. #1, it kept comming loose from the mount. #2 it got hot from frequent QSY's a burned up the two chokes & reg trans(among other things). New board cost $70 so I figured hell with that! It worked good, when it worked!

Hi,

Probably the table didn't display rigth, at least not in my PC. I upload it to the yahoo group files. Sorry about this.

Steve:

To much MDS is probably not productive. I also use my FT-897 in the same way but with the 2.3 Khz filter for digimods, the murata filter for voice and the 500 Hz filter for CW and RTTY. On TX I allways use the optional 2.3 Khz filter for better audio and probaly +0.5 Db more power. If the band is not very crowded this radio is exelent, but in contest (I'm not a fan of contesting) I realy need to turn back the RF gain, I end to QSY for the WARC bands. In my opinion this radio does'nt work very well in crouwded bands, I'm not able to mesure it, this is only a subjective opinion.

Yahoo group: FT897 (2009)
Date: 2009-10-22 16:33:57 UTC
From: JohnB
Topic: 28071 Message: 28088

I'm using an Samlux SEC1235M switching power supply. It supply 13.7 V at up to 35A. It's low noise and leaves room to grow.

Personally I don't like the internal power supply simply because it only powers the 897D, and I actually intend to get the batteries for mine for field use. With an external power supply you also can run multiple radios and the power supply can be used with your next radio if and when you upgrade.

Hi.
I'm using a Alinco DM-330 MVE switching power supply (http://www.alinco.com/Products/DM330MVE/) 30A max current, 5-15V voltage. It has 2 sets of snap-in terminals (Max 5A), a car plug for 10A and one set of terminals for 30A. Also has a preset button (you can preset the output voltage - disables the voltage adjust knob), A-meter / V-meter switch. Personally i like it very much... it is small and very silent.

Samlex and Astron both make excellent power supplies. I've also heard good things about Daiwa units. MFJ's quality control in their power supplies, as with most of their gear, seems to be spotty. Two of my friends have the 45A MFJ supply -- one has worked fine for years and the other has been back to MFJ twice for repairs in 2.5 years.

Whatever brand you get, I recommend that you get a variable voltage unit. As you add gear to your shack, you'll need to bring the supply voltage up to compensate for the increased draw. Also, if you decide to use a WMR SuperPWRGate to maintain a charge in one or more batteries as I do, you'll need to increase the voltage to compensate for the voltage drop through the Schottky diode to achieve the proper charge voltage.

From: "Glenn (KØBO)"
Topic: 28069 Message: 28091

Consider a shack 13.8v system instead of a simple supply.

Mine is as follows...
12v float charger w/equalizer 50amps $184.0
http://www.iotaengineering.com/dls55.htm
Get the optional http://www.iotaengineering.com/iq.htm
This unit can also be a stand alone power supply if no batts!!

2 matched 12v deap cycle batteries in parallel
(fuses between batteries that were purchased from the same lot)

Power fuse and distributional buss
Though my distro system is a old telco system, there are a few companies
making power quick connect power busses with fusing system.

Use large wire between radios and buss. Oversize is good!

What this gives me is a supply that can run for two or three days of heavy when
I loose my commercial utility power. I have no switching when power goes out as
the radios are always on the 12v system. I also have my shack wired for minimal
12v lighting. The computer is on it's own UPS with oversized batteries and
allows me 7 hours.

On FD, just pull the plug and you can increase your class.

Hope this helps! 73!

I've done this on other radios of similar construction.

I've had to carefully use a 150w solder gun. It seems dangerous but it's worked great once I got the touch. The hard part is to make sure you use enough heat to totally melt all the solder without using too much heat to destroy other connections. Don't pull the xsistor too early before all the solder throughly melts or you will lift the trace!

On a IC706, the drivers have to be removed using two solder guns as the heat dissipation was pretty fast. Quickly heat the xsistors up, remove the xsistors, then spray cooling mist or liquid air to cool the board back down. I generally use alcohol to cool the board down as I don't like the thermal shock of canned air. It was not uncommon to have a nearby component become dislodged. You will have to repair that when you mount the new xsistor which is just as hard as removing the old one.

Also remember to wipe of the old silicone grease and use fresh!

Looking for ideas on what most people are doing when you want to use the CAT
and a amplifier at the same time? I like the I-CAT solution from W4RT but
it seems a little expensive to me.

That is strange, since I see all of mine. Is it a feature of your email client? I've checked Yahoo and don't find an option to not receive my posts. I've used many email clients, including ,on occasion, my ISP's web mail.

Sounds right to me - I'm subscribed to a few mailing lists (yahoo and
normal) on both my normal account, and a gmail account I use for
outage notifications - the emails I send from the gmail account never
get seen back in my gmail inbox.. http://groups.google.com/group/Gmail-Help-Message-Delive
ry-en/browse_thread/thread/d4e5dbb4139ae8ca?pli=1
confirms this behaviour..

Thanks for investigating this.

If one uses a POP/SMTP email client to manage their mail, and only uses gmail for forwarding without normally using the web interface, they may be able to get around this by using their ISP/work SMTP server to sent the mail. Then gmail would not have the original, and would thus send the list's version via POP.

I just suggested to some people that they set up gmail accounts to forward their email via POP/SMTP because they were changing ISPs. I will now have to have them change their email again away from gmail because of this flaw.

(They would use the web access regularly.) It affects a lot more than just lists. For instance, if a gmail user was away from their POP account and used the web to send themselves a file or reminder, it would not be delivered to their POP account.

According to information from the links poseted here, gmail only looks at the Message-Id header to determine duplicates, not the rest of the message. Consider a gmail user who only periodically reviews posts from a group. If another person sent an message to the group, but also copied the gmail user because they would be interested, the gmail user would only receive one of the mails: if the direct mail was received first, the gmail user couldn't respond to the group; if the list mail was first, the gmail user wouldn't be alerted to the item.

Some posting about this problem have stated that it affected google apps as well, and prevented them from deploying them at work.

Anyway, thanks for following up on this: it will prevent problems for me in the future. I'm dropping out of the thread now since discussing problems the flaw causes beyond this group is most likely off topic.

73,
kg4jix - randy.

28101. DTMF

Yahoo group: FT897 (2009)
Date: 2009-10-23 10:11:03 UTC
From: m3pww
Topic: 28101 Message: 28101

Hello to the group

I have been trying to get into a IRLP node which is near to me and I have found that the DTMF tones from my MH-59 microphone is not loud enough as when I try using a pocket tone dialer I get onto the node everytime.

Question....

Can the volume of the tones from the MH-59 mic be increased and if so how ??

Many Thanks

Paul M3PWW

a quick google search and a scan of the manual (searching for dtmf) did
not yield anything that related to the volume being adjustable.

I am curious, are you using FM? If you are using SSB you may be able to
adjust the gain somewhat but that may make it more difficult to talk...

I have emailed my contact at vertex/yaesu asking this question, however
its almost 4am here so I do not expect an answer for hours.

When you get a chance can you post the settings? I've gone through the menu many times trying to activate the dtmf function for this mic with no success, and other sources telling me that it won't work with the ft-897. Thanks for your help.

There are at least two versions of the Operating manual. The longer one is
3.2m. In it, on page 60 it mentions menu item 59 with it you can select
between NORmal ReMoTe or CAT

You should try Remote (REM). Although this is for the microphone MH-59, it
may work for the less capable MH-36.

I can't say for sure as I have the OEM mic MH-31 (wo/ and DTMF buttons.

28108. built in SWR meter

Yahoo group: FT897 (2009)
Date: 2009-10-22 23:35:42 UTC
From: bryantmccall
Topic: 28108 Message: 28108

I set up an 897d with the ldg 897 turner and a simple (cheap) g5rv antenna. I was trying to make sure the swr was on after tuning with the ldg. I have 2 questions.

1. The swr meter has no numbers, only what I would call hash marks, and I have looked on line, and in the manual, and could find nothing about what marks were what values. can somebody please help tell me how to read my swr.

2. On 80, 40, 20, and 30, I saw very little if any change in the swr before and after using the tuner. I did hold the button and it did turn on the small red led, first solid, then blinking (or maybe the other way around) on the turner. Is this normal? or should I see a big change in the swr?

28109. noise

Yahoo group: FT897 (2009)

From: bragucci
Topic: 28109 Message: 28109

Hello:
I just picked mine up yesterday, FT897D. I notice rather high noise levels, shows about S7-S8 on the bar graph. Another question, the filters, what do they do and are they used to reduce the noise level?

Thx
Bart

TX amp and Cat for FT897D:
No problem , i use it at the same time, the CAT and AMP.
I mad a splitter cable, one plug into the set and two female for plugging in the CAT cable and the other for the solid state relais that I use to switch the amp with tx.
The leads are explaned in the manual.

Jethro,

I use a Jetstream model that is fully metered, front panel adjustable and automatically charges the backup lead/acid deep/cycle battery. I don't have the model number handy but google can be your friend for that hi hi.

Hi Everyone,
Can anyone recommend an excellent power supply to use at the base station for the 897D? I want something that I could run other equipment off of and for future equipment growth.

Thanks,

Jethro

I use a Samlex SEC1235M. It has volt and amp meters built in, 30 amps continuous and 35 amps intermittent. This should give you the power you need. It also has a a 3 year warranty. Bought mine form HRO for $139. Great unit so far!

Bart:

A few questions....

* What does the noise sound like?

* Does the noise go away when you disconnect the antenna?

* Is the noise mostly on the lower bands or do you also have high noise levels up to 10 and 6 Meters.

* What kind of antenna are you using and what's around it (power lines, other buildings, etc...)?

* Is your antenna directional and rotateable, and if so is the noise stronger in certain directions?

* Are you close to an AM broadcast station (within about 2-5 miles)?

* Do you have many computers or other potential noise sources running in your house?

The filters help eliminate nearby interfering signals and can help to reduce noise. They likely won't turn an S8 noise level into an S1 noise level.

FT-897 Bar Display Explanation

Sign in to the FT-897 Yahoo Group
Click on "FILES"
Search for Message 5278 - You'll find more than you ever wanted to know!

I forgot to mention the really simple answer. Go to W4RT Electronics http://www.w4wb.com/index.htm , buy an FT-Meter (best $45 I ever spent) and plug it in. Done! It has a very good numerically scaled back-lit dial. (you'll need an external 12 vdc 60 ma source for the illumination) (I modified a junk box 12 vdc wall wart).

Good Luck

Looking around, I confirmed my suspicions. It's a standard log scale
(Looks like anyway)

```
|__|__|__|__|__|__|__|__|____|____|____|
^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^
1 2 3 4 5 6 7 8 9 20 40 60
```

What THESE numbers mean... well they get bigger don't they?!? And more's
better.

>
> 2. On 80, 40, 20, and 30, I saw very little if any change in the swr

Hi Chuck,
The 897 replaces my Kenwood TS-820, which was attached to the same antenna, same location, same conditions. I did manage to get it down to S4 on the lower bands so I'm thinking this may be normal for this radio? I used the TS-820 for years so I may be used to a different level of static then what this little radio puts out. I made my first contact with this unit Sat morning to the west indies so I guess it's functioning ok. This weekend has been fantastic for DX, with the sunspots and the DX contests going on if you can't make an overseas contact something is wrong :)

Thx
Bart

Bart:

Considering that S-Meter calibration is not consistent between radios, it's possible you're really dealing with the same level of noise as you did with the TS-820. If you still have the 820 you could do an A-B comparison. Otherwise, I'm sure you'll know in a bit if your ability to copy other stations is about the same. There are, however, some things that have been known to introduce noise into 897s, including internal power supplies and strong signals from nearby AM broadcast stations. It sounds, however, like you're having good fun with the radio.

28122. Re: [FT897] Hello

Yahoo group: FT897 (2009)
Date: 2009-10-26 00:10:16 UTC
From: DavidN
Topic: 9692 Message: 28122

OK, if you don't mind the FM-Normal and FM-Narrow squelch settings being quite different, there not being enough IF gain so you have to turn the volume up to copy weak signals and the S-meter doesn't show correctly, that the memory tune cannot be altered from 2.5kHz steps to any other step even if you set it in the menu, and that on receive FM can be quite muddy on many FM stations (OK on SSB for some reason).

Otherwise the 897 is OK, especially if you have the MH-59 mic (has to be purchased seperately as Yaesu kindly give a non-DTMF mic with the rig (absolutely no use in the UK with IRLP nodes)), and adjust the SSB and FM mic gains (see other recent posts for settings).

It's not a small rig for installing in vehicles but I managed to shoe-horn it into my, let's say, economy car :) Good to be able to sort out all the memories by connecting to the computer. Don't bother with the expensive CAT cables, go to Ebay and you can get one for a good price. ;)

In the UK the internal batteries are £100 (quite a rip off) and the charger extra so go for the cheaper gel packs that are available if you truly want to go /P or go for an external battery and then get the full 100w.

I've not installed the alternative filters yet but those who have seem happy with the 2.9kHz for SSB (some think the 2.3 and 2.0 too narrow).

To sum up, this is a full HF reciever with many bells and whistles, for VHF/UHF it doesn't have all the bells and whistles that dedicated rigs for those bands have.

Any questions about particular aspects?

David G4TUP/9H3CU.

If you are looking at what all it can do then you will love it...It gives up some audio quality and it is a noisy radio compared to any Kenwood HF radio but it is still quite nice...I just sold 3 radios...2 vhf/uhf and a TS-50 HF radio and the 897 does everything they did...If however all you want is HF then I would buy a TS-480...

Yes there is.

Read the manual.

Read it a second time.

Read it a third time.

When you can't figure something out, read it again.

95% of the questions on this reflector are answered in the manual.

From KD5LBE

This may be a second posting my first didn't seem to make it. K9ZTV was a little hard but he is right that reading the manual and trying out the functions is the first thing that you should try, but there are three things that are not listed in the manuals. Get an antenna analyzer and check your antenna to be sure that you have something to transmit into. Second get an external watt meter, the thing in the radio is only marginal. And third, the manual says that you can transmit 100 watts SSB. Don't believe it, there are a lot of reasons so don't bundle up your radio and send it back. There have been a lot of questions asked about this subject and a lot to learn. The only real way to know what your radio can do is to transmit into a dummy load. Enjoy your new friend. 73's

From KD5LBE, Stewart

The response was a little hard, but he is right that reading the manual is more important than plugging in the radio. I would offer you three suggestions that are not in the manual. First get an antenna analyzer to make sure your radio is hooked up to a good antenna. Second, get an external watt meter to see what your radio is putting out and what is being reflected. Third, just because the book says you can put our 100 watts SSB don't expect it to do it. There are reasons that you will learn about as you spend more time in HAM radio. None of these suggestions are in the book.
Good luck and enjoy your new friend. 73

From: Bitpool
Topic: 28132 Message: 28132

HI!

This may be a bit off topic, but.. Does anyone know the physical size if the fans in the FT-897D?

At first glance it seem to me like it is the standard 60mm x 60mm x 25mm? Yes I could just disasemble the radio, but why make things harder than needed to :)

Thanks in advance

Cheers

28133. Memory Tune Step (was Re Hello)

Yahoo group: FT897 (2009)
Date: 2009-10-26 19:43:26 UTC
From: kav246
Topic: 28133 Message: 28133

First of all, sorry for the empty post that precedes this one. Looks like I done got a fat thumb!

So, in response to this snip from the "Hello" thread,

""the memory tune cannot be altered from 2.5kHz steps to any other step" ""even if you set it in the menu""

Mine is used almost exclusively as a "spot frequency" receiver. I have two VFOs set to certain spots and most of the memories loaded up with others so I almost never use any "tune" controls. Thus my curiosity got the better of me and I had to go switch it on and see what happened coz my vague recollection from the set up two odd years ago was that the above quote was not so in my case. Bear in mind that I could only check it "as it stands" as I've forgotton how to even change the step size!

No matter what I turned I couldn't get mine to tune in 2.5khz steps from a memory.

On SSB the steps are 1kc on the Ch selector knob and 100hz on the main dial. (I think thats right! Ch knob changes 3rd decimal place by ones, main vfo changes 5th!). On FM it was 12.5 on the Ch and 1kc on the main dial.

I know, in VFO mode I have 1 40m and 1 17m VFO which are stuck in 2.5kc step but I'm assuming that coz I forgot to store something when I prog'd it. The other two VFO's of the same bands are on single digits like I wanted.

One of these days I'll hook it up again and fix it, along with the various mems containing 7.000.00 but until then it does me as it is.

So, I'm sure if you keep trying you'll get shot of the 2.5s you just have to keep trying.

Kav

PS I just thought! Maybe the memory channel is storing the step size that particular VFO was in when you progged it. Try proging it again, from a VFO, making sure first that the VFO you use is set to the step size you require.

Okay, I just finished checking out my MH36 mic on the IRLP and ECHOLINK nodes with great success on the FT897D. You have to put Menu 059 in NOR to make it work. Was able to connect with Edmonton, Alberto, but no one answered my call.

28136. Swapping driver FETs in 857/897, step 2

Yahoo group: FT897 (2009)
Date: 2009-10-27 11:58:28 UTC
From: Geert Jan de Groot
Topic: 28136 Message: 28136

Some time ago I asked about how to replace the driver MOSFETs
on the main board (top) as mine were blown by a previous owner.

I have been able to successfully swap the defective 2SK2975
with RD07MVS1 MOSFETs. I was able to adjust bias (the old FETs
didn't do any of that), and was able to get plenty output
on nearly all the bands.

Nearly. Output on 70cms was extremely low, up to max 2.5W instead
of the 20W the rig should give.

I did check the power level from the driver stage (main board)
to the PA board, using the "red" cable to interconnect them.

I did an extensive check of all stages of the radio, and had a very
informative chat with one of the techs at Yaesu. Summary:
- Driver should provide at least 5W drive on VHF/UHF,
up to as much as 17W on the HF bands
- My rig provides all that, except that it's max 150mW on 70cm
- I ran the various stages through sweep generators, etc, and
found that all circuitry was working fine, the TX filters up to spec,
etc.
- Except the driver stage. Gain was 15dB down, compared to 2m.

Turns out that the 2SK2975 and RD07MVS1 are *not* interchangable,
and broken 2SK2975's really want to be replaced with other 2SK2975's,
not the newer part. There are some compensation networks that are
not easily adapted, that need to be changed when you change the part.

To make a long story brief, a couple of 2SK2975's (as well as
some other parts) are now on it's way to me.

I'll report back when I have been able to swap out the components affected,
but for now, in contrast to what mods.dk says, swapping them out may not
neccessary work. I hope my replacement 2SK2975's do work.
BTW, this is on a lot 07 radio.

Geert Jan

PS: the service manual typically found on the web is 'rev A'.
The latest is 'rev C' and is a lot, lot different. Be aware!

28138. Clicking Noise on 2m tx

Yahoo group: FT897 (2009)
Date: 2009-10-27 20:16:15 UTC
From: Scot Jones
Topic: 28133 Message: 28138

Hi,

Ive noticed an interesting problem on my 897.

When transmitting on 2m FM I can hear a faint clicking from the radio.

The voltage is around 11.5 volts, could this be the reason?

I don't notice any power drop and the swr is about 1.5 according to the radios external meter.

Any ideas?

Kind regards, Scot M1AFY

From: k5wlf@rebelwolf.com
Topic: 28139 Message: 28139

The radio is rated for 13.8 VDC ?15%. That gives it a low-end spec of 11.73 volts. I can't tell you for sure what's causing the clicking, but try bringing the voltage up within factory specs -- preferably around 13.8 -- and see if it goes away.

From: KD5BLZ
Topic: 28140 Message: 28140

Hi
I recently purchased a ldg ft-meter my 897d was working great before I installed it. The Radio was turned off during install.
Now I cannot transmit on HF. Even if I disconnect and reset my rig no luck.
Works fine on VHF and UHF any ideals?
Thanks

This is a similar problem to the finals of the FT-817.. Users are recommended to change out the whole board (ita separate PCB which s convienient) as the circuitry had to be changed and as you observed the RD07MS1 is not a direct replacement. But maybe a look at the new finals board for the FT-817 would give ou the changes you requie to get the gain on 70cm??

Hi GJ,

Yes, the most widely spread service manual is version A of 1003. You say that the latest version is very different. My question: How did you put your hands on version C? I am very interested!

I got a number of questions like this:

> Yes, the most widely spread service manual is version A of 1003.
> You say that the latest version is very different.
> My question: How did you put your hands on version C? I am very interested!

Yaesu UK has been very helpful shipping both service manuals and parts,
for a modest fee. I am happy to pay for that - hopefully it helps
keeping the spares/doc services available to us.

I must admit it's a damn shame that the dealers, these days, don't
carry these items anymore.

From speaking to the Yaesu tech, the big difference is that the A rev
(which I have) only shows one set of schematics/drawings, while the
C rev shows the diagrams of the different lot numbers
(and thus, differences in driver circuits, etc)
Since I'm working out these differences, I did order the C manual
with my latest spares order.

The FT-897D service manual that I have is dated 2005. It covers up to lot 51. For example on the first page of the MAIN Unit parts list, it has a break down for lots 1-28, 29-50 and 51-. There are four different layouts for the PANEL Unit; original, lots 3-, 12- and 13-. This manual does not note the change of the 2SC3102 drivers to RD70HVF1.

kinkos :)

There are PDF versions, if you do not want to print them yourself, you can go to a place like kinkos which can print and bind if it that is what you want.

Look in the files section of the yahoo group for them. I am fairly sure they are current, if you have doubts about them being current you can goto yaesu's page and I do believe they have them online ready for download.

I believe the only files available for download on the Yaesu site are the Operator Manual and a Brochure which is meant more for advertising.

I have found a few places on the web that have the PDM of the manual for download but they are all old versions. There is nothing available that I have found anywhere for the current version of the rig (my main board is stamped V8). If anyone finds otherwise let me know.

In the meantime I belive you can buy a copy directly from Yaesu for the current veriosn, but I do not know the price. I haven't bought one yet.

NEW MICROPHONE CABLE SPECIFICALLY MADE FOR
YAESU FT-897
WILL ALSO WORK WITH YAESU FT-857 AND YAESU FT-817
MH 36 E8J MICROPHONE CABLE

THESE MIC CABLES ARE A LITTLE LONGER, HEAVIER RUBBER AND NOT AS "STIFF" AS THE CABLE THAT COME WITH THE RADIO. I HAVE A 'JA" FRIEND IN JAPAN I ORDER THESE FROM. THEY ARE EXCELLENT CABLES. I SELL A LOT OF THEM FOR OTHER YAESU RADIOS, AND ORDERED A FEW OF THESE BECAUSE I FIGUED WELL HE COULD THROW IT IN THE SAME BOX AS THE OTHERS AND SHIPPING WOULD BE ABOUT THE SAME. I WILL LET THESE GO AT ABOUT WHAT THEY COST ME.

SEVERAL OF YOU HAVE BOUGHT ONE AND I HAVE GOT GOOD FEEEDBACK FROM YOU. THANKS

TAKES 30 SECS TO HOOK UP ONCE THE 3 SCREWS ON THE MIC ARE LOOSE !!!!

I HAVE FOUR LEFT AND THAT IS IT.

$22 + $3 SHIPPING
THAT WILL INCLUDE SHIPPING IN THE USA
PAYPAL OR A MONEY ORDER OR A CHECK IS FINE.

EMAIL ME AT
WA4ZVG@...

IF YOU WANT TO PAY BY PAYPAL EMAIL ADDRESS ABOVE IS TIED TO THE PAYPAL ACCOUNT. PLEASE MARK THE PERSONAL TAB WHEN YOU GO TO PAY SO IT DOESN'T CHARGE ANY SERVICE CHARGE.

PAYPAL HAS A NEW RULE IF IT IS FOR PERSONAL USE ON THE MONEY YOU SEND THEY WAIVE THE FEES. THEERE IS A TAB THERE WHEN YOU PUT THE AMOUNT IN. JUST CLICK IT.

Sent: Thu, October 22, 2009 7:35:42 PM
Subject: [FT897] built in SWR meter

I set up an 897d with the ldg 897 turner and a simple (cheap) g5rv antenna. I was trying to make sure the swr was on after tuning with the ldg. I have 2 questions.

1. The swr meter has no numbers, only what I would call hash marks, and I have looked on line, and in the manual, and could find nothing about what marks were what values. can somebody please help tell me how to read my swr.

2. On 80, 40, 20, and 30, I saw very little if any change in the swr before and after using the tuner. I did hold the button and it did turn on the small red led, first solid, then blinking (or maybe the other way around) on the turner. Is this normal? or should I see a big change in the swr?

From: Ron
Topic: 28109 Message: 28153

There is a strange 'feature' called IPO, see MFm, A button. Turning ON IPO actually turns OFF the preamp which is not usually needed on lower bands. An 'I' incidator will appear on the LCD when the preamp is off. Reduces noise a lot and make the receiver nicer to use for me. This is suggested on some page in the manual that I do not have in front of me at the moment.

> > The 897 replaces my Kenwood TS-820, which was attached to the same antenna, same location, same conditions. I did manage to get it down to S4 on the lower bands so I'm thinking this may be normal for this radio? I used the TS-820 for years so I may be used to a different level of static then what this little radio puts out. I made my first contact with this unit Sat morning to the west indies so I guess it's functioning ok. This weekend has been fantastic for DX, with the sunspots and the DX contests going on if you can't make an overseas contact something is wrong :)

I just received an FT-897D and I'm attempting to get it set-up for use with Airmail (HF Pactor). I have an old Kantronics KAM Plus TNC with homebrewed the cables. When I click on the connect button in Airmail, the radio immediately transmits but it stays in transmit mode. It does not switch back and forth to receive mode as it should. I've checked the AGC (fast in DIG mode), set the DIG GAIN to 22 (so that ALC meter shows just a couple of bars), checked my cable pin-outs, added ferrites (in case there was stray RFI) but nothing seems to work. Any ideas on what could be going wrong or if I missed a setting somewhere in the radio menu or Airmail setting?

28158. Internal Keyer Issues

Yahoo group: FT897 (2009)
Date: 2009-10-28 22:06:52 UTC
From: John Grimmett
Topic: 28158 Message: 28158

Greetings,
I am experiencing a problem with the internal CW keyer on my 897. The iambic paddle no longer generates dits and dahs. The dahs work fine on the left paddle but the dits on the right paddle do nothing. I have confirmed that the paddle itself is fine as I have a viable circuit from ground through both poles to the correct band on the plug. The CW Key REV setting via menu [25] seems to have no effect. What am I doing wrong?

Thanks,
John

> This may be a second posting my first didn't seem to make it. K9ZTV was a little hard but he is right that reading the manual and trying out the functions is the first thing that you should try, but there are three things that are not listed in the manuals. Get an antenna analyzer and check your antenna to be sure that you have something to transmit into. Second get an external watt meter, the thing in the radio is only marginal. And third, the manual says that you can transmit 100 watts SSB. Don't believe it, there are a lot of reasons so don't bundle up your radio and send it back. There have been a lot of questions asked about this subject and a lot to learn. The only real way to know what your radio can do is to transmit into a dummy load. Enjoy your new friend. 73's

From: drgps28
Topic: 28162 Message: 28162

I've been using an IC-735 with a Kantronics KAM Plus TNC and Airmail has been working flawlessly. I just hooked up a new radio (FT-897D) and interface cable and now I can not get Airmail to work properly in HF terminal mode. When I click on the connect button, the radio transmit good tones (I'm monitoring on another radio) but the radio stays locked in transmit mode. The radio does not switch to receive mode in between "chirps". Consequently I can not connect to any Winlink RMS Pactor station. I've added ferrites to the cable but the problem persists. Any ideas what could be going on? Ross KC2LOC /AAR2BX NY

Should be? I would consider those optional -- at first anyway. Borrow a
friends analyzer (-: The radio has a SWR meter built in. You can do better
and I would recommend the MFJ 259 when you get money ahead.

Now if money is NO object start out with that. You can get the watt meter
from LDG as it plugs into the little known jack in the bottom of the radio.

And if money is REALLY no object... you can figure my addy from my call.

From: Hank
Topic: 9692 Message: 28166

I am using the LDG FT-Meter, and I love it. I know it's not a true watt meter like a Bird, but it does give me a better view of what's going on, unlike the panel meter.

If I were to buy an external watt meter in the traditional sense, it would be a Bird. Used them in the USAF, and they were very accurate.

Nathan,

You say you "installed it"? It just plugs into the socket under the front edge of the '897 just to the right of the main tuning knob. Be sure it's plugged in all the way.

Good luck,

Lou - W6UR

Sure,

Here is the company link: http://www.ldgelectronics.com/c/252/products/1/7/1

and here is the eham reviews: http://www.eham.net/reviews/detail/3265

I have had no problems with mine at all, and it has tuned everything I have thrown at it. I have heard the Yaesu tuner is not as good, as the SWR has to be fairly close, while the LDG doesn't. I can only attest to the LDG, and it is doing a wonderful job.

hth,

Hank / KB4MTO

From: pjseraf
Topic: 27846 Message: 28173

My FT-897D noise problem is now fixed. I sent my FT897D to Yaesu Service in California and just got the rig back. They replaced 2 ceramic filters and one ceramic disc. The technician indicated that they had seen this problem before. I am happy that they fixed it at a reasonable price. I am happy with Yaesu sevice and now have a great rig for portable operation.

> I too have a similar problem with my FT897D which I recently purchased used on-line. I will not do that again.
>
> I looked at your video and mine has the same type of noise on all bands with the antenna disconnected and the FT897D has been tested on 2 different power supplies and a battery with the same result. My FT897D is really noisy using AM mode and no antenna. It has reached as high as S9 on occassion and it is a function of temperature. It is less noisy with SSB but that may be a funtion of the ssb filter. If the unit is on a long time it will sometimes disapear. I am convinced the problem is in the radio because none of my other rigs exibit this problem.
>
> I haven't really tried the FM section to see if it behaves like your unit does. I hope we can find the problem as it looks like a nice radio but right now I am disapointed with my recent purchase.

The noise can be heard on FM when someone transmits on that frequency... that noise makes the receiving unreadable (a strong BZZZZ). SQL does not solves anything (even with max SQL, the signal is still there on the S meter). On SSB and AM the noise can be heard all the time. With RF gain you can cover it if you push it over S10 on the scale.

28174. Re: [FT897] Re: Hello

Yahoo group: FT897 (2009)
Date: 2009-10-31 14:05:15 UTC
From: Lew Phelps K6LMP
Topic: 9692 Message: 28174

I have the Yaesu tuner -- the older FC-30 model. I got it as part of a package deal with another ham, swapping my FT-8900 for his FT-897, FC-30, and ATAS-25 backkpacker antenna. As has been noted frequently in this forum, the FC-30 is capable of matching only a 3:1 SWR ratio, compared with 10:1 for the LDG tuner. This doesn't make the Yaesu product a bad product.

The following discussions are based on the output of two modeling programs: EZNEC for the antenna, and TLW (Transmission Line for Windows) for the line loss and tuner configuration calculations. Warning: the following gets a bit technical.

I think it's sometimes overlooked in that a tuner capable of matching very high SWR does not "fix" all problems caused by a severely mismatched antenna. Let's assume, for discussion, that you have an antenna than presents a load of 2 -j0 ohm load to the coax. It's not difficult to construct such an antenna as a physically short dipole with loading coils (for example a Buddipole style portable dipole). With the antenna's coils tuned so the antenna is resonant (j=0) the resistance is very low because the antenna is far shorter than a quarter wave length. The 2 ohm load equals a 25:1 SWR. I doubt the LDG could handle that mismatch. A low-pass pi-network tuner that matches such an antenna requires inductance of 3.24 microhenries and shunt caps of 86 picofarad on the input side and 500 picofarad on the output side. However, even though tuners can be configured to present a 50 ohm load (1:1 SWR) to the transmitter, you still don't have an efficient system. Specifically, if you assume 50 feet of RG-8X cable (a reasonable choice for a portable antenna setup) when transmitting at 100 watts you are going to have tuner loss of 4 watts and transmission line loss of 49 watts, with only 47 watts going out of the antenna and over the air. Because of the mismatched antenna, half the transmitter power is turned into heat, even though the tuner "matches" the antenna to the transmitter.

To take a another example, assume a 10.0 meter vertical whip without a loading coil whose feed point is 1 meter above ground, operating as an end-fed whip in the 10 meter band. (OK, this isn't realistic, but I modeled this because it creates a 10:1 SWR.) Further assume a mobile installation with 20 feet of RG-174 mini-coax between the rig and the antenna on your rear bumper. (At 28.9 mHz (near the middle of the 10 meter band) this antenna presents a total impedance of 329 -j240 ohms, which equals about 500 ohms net and thus creates an SWR of 10:1 -- which the LDG can match, but you will encounter significant transmission line loss because of the mismatch that now exists between the tuner and the antenna, even with a short coax run in a vehicle. Specifically, the loss will be 48 watts lost in the cable, 8 watts

lost in the tuner, and 44 watts going out over the air. If you assume 15 feet of RG-174, you lose 8 watts in the tuner and 37 watts in the transmission line, resulting in 55 watts at the antenna. (By the way,

The point is straightforward: for an efficient transmission SYSTEM, you need an antenna that is relatively closely matched to the impedance that the transmitter expects. Aa badly mismatched antenna will always create significant line losses, even if you are using a tuner that presents a 50 ohm reactance load to the transmitter (1:1 SWR). (You can greatly reduce line losses by using 450 ohm ladder line, but I'll leave that for another discussion.)

If you start with the premise that it's better to have a relatively closely matched antenna to begin with, the Yaesu tuner is a rational alternative. For example, I use mine installed in my car. I have a set of mono-band Hustler vertical antennas that I carry in the car. These antennas all have loading coils, and all can all be adjusted to resonance within their band. However, (especially at the lower frequencies) they do not provide a low SWR across the entire band. The FC-30 solves that problem; it will allow me to transmit on almost the entire 40 meter band, and from 3.75 mH to 4.0 mHz on the 75/80 meter band. Without the tuner, I am restricted to about 100 kHz on the 75-80 meter band and about 200 hHz on the 40-meter band with the Hustler whips.

To put it another way, a 10:1 SWR matching capability will allow you to transmit on a wider range of antennas than a 3:1 matching capability. It will tune a long wire. It will tune your neighbor's wire fence. It will tune a rain gutter. But the signal you are transmitting (and receiving) will be significantly diminished at SWR ratios exceeding 2:1 or 3:1. At 10:1 SWR, you can experience transmission line losses of 2.5 dB or higher -- essentially cutting your transmitter power and receiver sensitivity in half. Why spend all that money on a good rig like the FT-897 and then turn it into a crummy rig by attaching it to a badly mismatched antenna?

Sometimes you have no choice. Every installation has its own challenges, but you're ALWAYS better off with an antenna that offers an impedance at or near 50 ohms. For antennas that cannot achieve that result (such as Yagis or physically short dipoles with loading coils), the best solution is to transform reactance to 50 ohms AT THE ANTENNA with a balun or (as is the practice with Yagis) T-match, gamma match or other matching systems. These solutions are discussed in detail in the ARRL Antenna Book.

Should be? I would consider those optional -- at first anyway. Borrow a
friends analyzer (-: The radio has a SWR meter built in. You can do better
and I would recommend the MFJ 259 when you get money ahead.

Now if money is NO object start out with that. You can get the watt meter
from LDG as it plugs into the little known jack in the bottom of the radio.

And if money is REALLY no object... you can figure my addy from my call.

25 - 75 dollars? Truly too good to be true for a working Bird or even a
single slug. Watch yourself.

If you have a HT and a good 5W slug and small dummy load, check any unit
before you buy it.

Subject: [FT897] Buffer to key amp SB 220

Hey there is a guy who sells the buffer to key the SB 220 , or any other amp for that matter, that he makes specifically for the ft-857.

Do9es anyone have his contact info, or know where I can get one made specifically made for this radio so that I can use my amp with it?

Thanks,

WA4ZVG

If you want to make your own , it is on the 857 list files section.

I installed 12 volt reed relay in mine for a buffer so it will key high current amp relays.

Dale

Hello,

I have a new version FT-897D radio and I will like to extend the TX range but is a problem is not working, I have set the jumpers but no result is still loked.

So is someone that can help me?

Thx in advance.

Aurel.

From: Michael Walker
Topic: 28177 Message: 28185

maybe...depends how it got moded.

Take a voltmeter and measure the voltage on the relay contacts to the amp with the amp turned on. That will give you the open circuit voltage. It might be 120vac (or 220vac). If it is that, then you need an external relay. If it is 12vdc (or less), then you are ok.

Next, put your meter in current mode and then connect to each lead of the Relay connector. You can do this without the map connected to either a radio or antenna. Measure the current the keying relay draws.

As long as the voltage and current is less then the specs on the 897 Amp keying circuit, you are ok.

It is important that you understand how this works and how it affects your amplifier. There are a number of things that are an 'appliance' in the ham radio world. An SB200 (or 220) is not. It would be very helpful to have another ham onsite with you the first time you hook it up.

Personally, I would open it up and look and see what is installed. It is clearly obvious what is new technology and what is old.

Subject: [FT897] Internal Keyer Issues

Greetings,
I am experiencing a problem with the internal CW keyer on my 897. The iambic paddle no longer generates dits and dahs. The dahs work fine on the left paddle but the dits on the right paddle do nothing. I have confirmed that the paddle itself is fine as I have a viable circuit from ground through both poles to the correct band on the plug. The CW Key REV setting via menu [25] seems to have no effect. What am I doing wrong?

Thanks,
John

28188. What is the used price today for a FT-897?

Yahoo group: FT897 (2009)
Date: 2009-11-01 01:59:11 UTC
From: Don
Topic: 28188 Message: 28188

GE,
Thanks for letting me post here and my question is for those owners of the FT-897 can you give me your best guess price of `fair' market value for this rig? I would appreciate listing:

- Low end price (working but not in the best physical condition)
- Medium price (working in good condition)
- High end price (working and perfect condition).

I would be interested greatly appreciate your thoughts on fair price or estimates.

One place to look, in addition to anything said here, would be qrz.com forums. People sell radios all the time there, and you can get a good feel for what people are asking for the radios, as well as seeing which listings sell and which ones dont, which can give you a feel for what the actual sales price is (although you may not know if the price was altered outside the forums).

What I have seen is about $100 less than MSRP for many used radios of roughly this price, which for me is too close to the new price and would push me towards new. In some instances I have seen people sell their radios for the same price as new, and it is my belief that people look at what they paid originally for the radio and do not take into account that new radios have come down in price (although recently Yaesu did raise the price of its radios). I am not a believer that radios increase in value as time goes on, as such I personally think that a fair used price is about 75% of what a new one similarly equipped goes for, and you go down for cosmetic or functional defects.

I know this has probably been covered here before, and it's been covered other places as well.

When you say "Lower Bands" are you talking lower according to frequency or according to band plan?

If 20 Meters were the dividing line, by Band your statement would cover from 20 Meters to 70 cm band. By frequency 20 meters (14 Mhz) through 160 meters (1.8 Mhz). I know this has caused confusion in the past at other places and would like to make sure we're all on the same page.

Thanks
Sam NW9T

Hi!

I am new to all this; just purchased this rig a couple of weeks ago and I'm having a hard time figuring it out.
Also just got my technician license a couple of weeks ago.
We bought this radio because we plan to get the general license in the near future.
I am trying to enable the Dial knob on the FM, 2 meter mode. I did get the value changed to "enable" but I'm still not able to use the dial knob.
I am trying to do fine tuning; right now the radio jumps frequencies in intervals of 10; 5 would be nice...

Any help would be appreciated.

Thanks!

28194. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-11-01 07:38:07 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 28194

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

Starting around page 54 of the manual the Menu's used in the radio are
written about and contain short informational text about their function.
Going from a all dials and knobs radio to a computer menu driven radio
can cause frustation. FM step is menu # 52 for the mem/vfo ch knob &
Page 22 discusses setting the dial speed by pressing the power button
momentarily and the display will show a running stick figure
in the bottom right of the LCD display.

Following up on Keith's response to your question, yes, menu item 52, "FM STEP", allows you to change the size of the frequency step as you turn the MEM/VFO CH knob in FM mode when using a VFO. If you try single sideband, though, you'll see that setting doesn't apply to that mode. There is a separate setting in menu item 82, "SSB STEP", to set the frequency step for SSB operation.

It is important that you read and play with the memory functions starting on page 52. Hold down the F key until the memory mode shows up. Go to 052 turning the mem dial on the right. Adjust the the big dial until you get the steps you want in FM. FM steps given are sufficient for what you are going to need. When it shows 5 in the window hit the F key again. Read and reread the book. It makes the radio a lot more fun.

I'm told these links can/do change. So with that in mind, click on the flies link at the bottom of most messages. The FIRST sub-catagory is Manuals. The second one down is > FT-897 Schematic Diagram.pdf < After that, you're on your own. I saw something that looked like what you're talking about, but I saw it first thing, so THAT can't be what you meant.

As far as sourcing the part... let us know what you turn up. Sounds like more folks might want that info too.

Good Luck!

If you want to put a buffer between the 897 and most any amp, use the ARB-704 from Ameritron. Works like a champ.

W4RT also has great accessories for the 897 including a CAT port expander and DSP add-ins.

28203. Programming memory wit interface

Yahoo group: FT897 (2009)
Date: 2009-11-02 19:13:40 UTC
From: Barra
Topic: 28193 Message: 28203

I recently bought a Microham USBIII interface. It is capable of operating many digital modes and operating the radio from the PC by an integrated CAT connection. The interface has it's own soundcard.

I am now looking for software, preferably freeware, that will allow me to connect to the FT897 via the interface to address and manage the memory channels in the 897.

The makers of Microham tell me it will work as long as this software addresses a com port.

Any idea what software I might be looking at?

Mararten,

There are a lot of terrific choices out there that are completely free (or have a very low registration cost).

I use DXLab suite for radio control and

MultiPSK for digital modes.

if you want to help me map out memory I have been writing some perl
tools that do that. I have some of the channels mapped out but not all
the different options.

Hello Bret

I suggest you look at FTBasicMMO on:

http://www.g4hfq.co.uk/ <http://www.0xdecafbad.com/?p=154>
<http://www.0xdecafbad.com/?p=154>
This program is simple to operate, very powerful and only costs ?10

mine costs 0, I have done it as a community effort. Why would you
suggest that I stop providing information for free and software for free
and instead go to software that does not work in the operating system I
prefer and costs money?

I did the stuff I am doing in perl because it works in windows, osx,
linux, *BSD, solaris, and more.

28209. Re: Programming memory wit interface

Yahoo group: FT897 (2009)
Date: 2009-11-05 02:08:05 UTC
From: dj7sw
Topic: 28193 Message: 28209

I do use a simple program made by DG5KW, named FT857DRW.ZIP.
The free-download adress is:

http://www.mydarc.de/dc5kw/

This program reads all 210 memories and writes the content into
a .csv file. This file can then edited by excel or any other
csv editor. I believe excel is an overkill for this purpose.
A gud csv editor (cardware=send a qsl hi hi) is found here:

http://csved.sjfrancke.nl/index.html

The edited file is then writen back into FT 857/859 memories.

One memory-line consists of nine colums separated by semicolon:

Colum 1 = M or P (M=memory, P=Part of Scan pair)
Colum 2 = empty or asterix if skiped during scan
Colum 3 = Memory number
Colum 4 = type of modulation RX (AM-FM-WFM-USB-LSB-CW)
Coöum 5 = RX QRG (example 14450000)
Colum 6 = TX QRG or -R for repeatershift (Menue 76)or empty
Colum 7 = type of modulation TX (AM-FM-WFM-USB-LSB-CW)
Colum 8 = Label (max 8 letters/sigs/spaces)
Colum 9 = asterix if label is to show, empty means show QRG

I programed all 70cm and 2m relay channels from number 200 backwards,
the available relais in my area are labeld with their names, and even
the broadcast and FM channels have proper labels now. I like this
new "knob rotary feeling". I even made different files for north and
south german areas.

If you need more than 200 channels say several hundreds you may hold the qrg lists on your computer. A nice program for this application is made by OK1FIG.

http://ok1fig.nagano.cz/vlr_overview.htm

73 and have fun

28210. Scanning?

Yahoo group: FT897 (2009)
Date: 2009-11-05 22:08:59 UTC
From: Damien Gardner Jnr
Topic: 28210 Message: 28210

Howdy Folks,

I've read through the manual for my 897D (which doesn't seem to say anything about scanning..), and I can't seem to find a really useful feature which my 10-year-old 8100 has.. - begin/end memories.. On my 8100, I can tell it to scan from one frequency to another freq and then come back and start again - makes it great for scanning a band looking for people talking.. I can't seem to find anything similar on the 897 - if i hit scan, it just starts scanning and works its way up through the band. And since noise is sitting on S7, and most signals also come in around 7-8, the scan is basically useless anyway (either it doesn't scan, or you set the squelch up and miss all the quiet stations... But when I'm sitting in the garage, I'd rather be pottering on some project or other and have the thing scanning (even if I have to hit a button to stop and go back manually if I hear something), than sit there turning a knob continously..

Any thoughts on how to go about that?? I've also looked through HRD, and that doesn't seem to have the option either.. (Although tuning through HRD is a bit iffy anyway, as it randomly changes USB/LSB/DIG/CW if you're tuning to 'favourites' rather than just entering a freq into the frequency display..)

Cheers,

DG

Hi Damien,

I suggest, then, that you re-read the manual particularly from page 45 (see index at teh front of the manual).

There is an entire section on scamming including exactly what you are talking about, Programmable Memory Scan which is on page 48 and does exactly what you are talking about. You can set up to 5 sets of upper and lower frequency limits and scann between them.

You must be reading a different manual??
Page 48 is "Scanning Operation" and continues to page 50.
All the scanning proceedures are there. There are more than one memory scan function and you can select the one that fits your criteria... be sure to set your squelch!
I would suggest downloading the PDF manual for easier reading and printing of a particular subject.
I have 155 channels programmed into my 897D, but I have not found it necessary to scan them although I can see why you want to.

From: Finnigann
Topic: 28214 Message: 28214

Is it possible to use the radio as a CW ractice machine. That is, to make the dots and dashes but not to send them over the air?

I know the radio will make a random series of 5 characters to test my recieve ability, But can I also send in the clear? I have re-read the CW part adn thought I was doing just that, but the more I read the manual the less I felt I was off air.

advTHANKSance

Quite so. I missed the part where I was to be in a CW mode.

And to the other ham that also recommended I RTM. Oh well thanks anyway.

I wasn't looking for anyone to do my homework. It just looked that way.

Thanks guys!

Yep, slightly different manual it would seem - my manual doesn't have the Programmable Memory Scan function at all! Which was what I was really missing, as I love it on my FT8100 :)
Actually it also doesn't have the page on Display Customisation - I thought I'd mis-read the reviews originally which said you could change the screen colour! Hrrm, I think I might print *this* manual out, and use it in place of the one that came with my rig :)

Hrrm, question re 'setting the SQL knob to the point where background noise is silenced'.. Am I just in a really horrid area for noise (two power stations within 10km, and a HV supply run about 100m north of me), or are Yaesu on drugs? Unless I'm above about 23mhz (the noise visibly drops between 22-24mhz from S9-S0), the squelch is completely useless, as any signal is going to be at a lower level than the background noise.. Except for a bunch of fellow VK contacts, my only success in hearing anything has been PSK31 from new caledonia!

Cheers,

Damien

28218. Re: [FT897] Re: Scanning?

Yahoo group: FT897 (2009)
Date: 2009-11-06 21:57:25 UTC
From: Allan Godney
Topic: 28210 Message: 28218

Hello Damien

Regarding the noise on HF. I also have high noise level S8 - S9, but I find that the 10db attenuator normally fixes the problem:
Tap the "F" key then using the "Mem / VFO set" knob select the "m" menu. Press the "B" key labeled "ATT" this puts in the 10db attenuator. The fact that my noise level normally drops to S0 suggests that it nulifies overloading of the front end as 10db should not drop the noise down to S0. Sometimes the "A" key marked "IPO" is sufficient to fix the problem.

Regards Allan M0CBG

Oh, wow!@#!

Did that, and it dropped the S+ noise on 10.147 down to S3, and all of a sudden I can decode the HF APRS going on there!

Thankyou VERY much :)

Regards,

Damien

From: Jim in Downers Grove
Topic: 28210 Message: 28220

It just so happens that I just tried doing the same thing with scanning via HRD. I'm not in front of my radio but I know that the scan dialogue box allowed be to set upper and lower frequencies for the scan. Take a look again.

I'd be happy to get the particulars for you. Just contact me off list so we don't make too much noise.

great idea Jim... I've never used the scan on HRD,but I have today.
Works real well. I used the "Scanning" menu to select the freqencies and then hit scan and it worked.
Now to figure in the pre-programmed 2m &70cm channels I already programmed in my FT-897D in more than one memory group.
Thanks and don't worry about the "noise" as more than 1 would like to know the particulars... that's what forums are all about.

From: Charles Scott
Topic: 28222 Message: 28223

Rick:

Your supply should definitely not sag 2 volts under an 18-20 Amp load, so it it's a meter on the supply or being measured at the supply terminals, you have a problem with the supply.

You should definitely not have 2 volts drop on your cabling to the radio. Assuming your cable between the supply and radio is 6' to 10', you'd have to be running something like 18 gauge or smaller cable to have that kind of voltage drop.

From that I think you can assume that you either have a bad supply, something wrong with a power connection or power cabling, or there's some problem with how you're measuring it.

28225. Iambic Paddle

Yahoo group: FT897 (2009)
Date: 2009-11-07 15:48:41 UTC
From: Risk
Topic: 28225 Message: 28225

Hi guys,

I know this has already been covered somewhat, but Im not quite sure Ive got this clear.

Basically, I have an MFJ-564 Iambic Paddle. It is wired as per the destructions. That bit wasnt hard. Now I don't know if I have an intermittent short or not, it certainly isnt showing up thus in a continuity check, but for the last 3 weeks since I have had it, I have been able to key both paddle keys without the 897's keyer being selected. Now it was only staying on for as long as I held the key, either key that is. Not sure if Im losing you yet, but please stay with me. Basically, the paddle was acting like a brass thumper but both sides were able to be selected. I was using the right side for dah's and the left for dits. Of course I was holding down the right side for longer obviously.

I happen to like this configuration and it was all going well, until this afternoon. All of a sudden, the right side will not activate. However, it does activate when Keyer is selected. And this is when I read the messages on here which told me, that to use it, the keyer must be on.

Without re-wiring the paddle is there any setting, I have missed that will revert the paddles usage to the way I had it ? It just doesnt feel like a short and with the keyer on, it seems really unnatural.

I get the point, but it really isnt my cup of tea. I know someone will just say "why dont you just wire both sides to a mono plug, or throw a stereo to mono adapter on the lead. Well, I could do either, but I really think there is something Im missing.

I may be wrong, been there before.

Cheers if you can help

Date: 2009-11-08 02:24:47 UTC
From: vk2faja
Topic: 28226 Message: 28226

Hi AlL

My radio has turns off and back on while going thew 70cm band.
it quickly turns off on back the last fenquice it was on and the same if im on mem chennals.

I have tried a master reset but this didnt solve the problem.

So has anyone else heard of this of had this problem them selfs

Hello, I've just purchased my FT-897 along with the LDG-897 tuner. Its all going well with the exception of interpreting the swr meter. I do appreciate the need to uses a separate meter where possible, but it has the feature and apparently no explanation in the hand book. for the record i have enabled swr and note a display crudely like this |_|_|_|

28228. FP-30 problems/comments?

Yahoo group: FT897 (2009)
Date: 2009-11-04 16:37:08 UTC
From: pilot g
Topic: 28228 Message: 28228

Hello,

I hope the administrator deletes my previous post (from a few minutes ago) askin about the FP-30 internal power supply part number. As usual, I needed to do a bit more research before asking a dumb question, so if the question got thru intact anyway, I apologize for its obvious lack of knowledge and effort reflection on me. I thought I had looked enough, when obviously I had not.

At any rate, I am awaiting my FT-897D, and at the time I didnt persue the internal power supply option. Now I am seriously considering it. But at over $200, I am wondering if anyone can give me their experiences with it, good or bad. I like the idea of having everying in one package. The shack gets cable-itis enough the way it is... But if its weak or they have trouble, I would like to know.

I am reading the hundreds (almost 300) on eham.net for the 897 (initial variant) but have not read much about the internal supply... mostly complaints about battery cost and the like.

Thanks for the help.

Wayne, ke0ms

Hi I've had my FT-897D a few days working fine on 2m/70cms. I took advantage of the good weather to install my HF antenna, its a bb6w. All is well, signals from USA to Russia were heard over most bands and all in i'm satisfied with the set up for now.

I have a problem with the 24mhz band, namely that I get TX error on any mode within the Uk allocation. Can anyone explain why that might be? I've read the manual but haven't noted this issue mentioned.

For the record 10m and 6 M work and its not that i have a need to use 12m, but i do want to know the rig is in full working order sooner rather tan later.

Your assistance is welcome,

Kind Regards,

Steve

I have had this problem occasionally since I bought my radio years ago - it is an ND version and the PSU is fine. I have had this problem also when running my radio off a car battery which was fully charged. I was always receiving when it happened and I still don't know why.

Please check you're PSU is ok - maybe try another PSU.

It has not happened often enough to worry me too much, especially when I see, on here, that it happens to other people. Its annoying when it happens, but I don't worry now.

FT-897 Bar Display Explanation

Sign in to the FT-897 Yahoo Group
Click on "MESSAGES"
Search for Message 5278 - You'll find more than you ever wanted to know!

I forgot to mention the really simple answer. Go to W4RT Electronics http://www.w4wb.com/index.htm , buy an FT-Meter (best $45 I ever spent) and plug it in. Done! It has a very good numerically scaled back-lit dial. (you'll need an external 12 vdc 60 ma source for the illumination) (I modified a junk box 12 vdc wall wart).

Good Luck

Hi

Yea I got the bolt on tuner from Yaesu for my 897 and I regret it.

it only tunes up to 2.5 SWR, also it takes up the cat port . I understand the tuner you got has a cat pass through so there is still a cat port available when it is being used.

Good job!

I'm using an LDG AT-897 tuner and love it. 10:1 tuning range and bolts

to the side of the radio. Can't beat it.

28242. Ham Friendly Property Available

Yahoo group: FT897 (2009)
Date: 2009-11-09 02:57:41 UTC
From: kc9foz
Topic: 28242 Message: 28242

This is a little off topic.

Is anyone looking for ham friendly property to buy around the Austin, TX area?

I am in the process of moving out of state for work and to be closer to my family. My wife and I are selling our house with 9.82 acres, and no restrictions or HOA's and can be ag-exempted. This place is perfect for a ham station and antenna farm and is priced to sell as we need to move by December 15th.

If you are interested please email me direct at KC9FOZ @ hotmail.com.

Thanks,
Tom

28246. Re: [FT897] FP-30 problems/comments?

Yahoo group: FT897 (2009)
Date: 2009-11-09 10:42:23 UTC
From: Dean Gibson AE7Q
Topic: 28228 Message: 28246

I have the FP-30 always attached to the bottom of the FT-897D. It just works (a "non-event").

I did unsolder the existing power cable from the FP-30 power supply board, and attached Anderson Powerpole connectors to the unsoldered ends. Then, I made & soldered a replacement power cable to the FP-30 power supply board, with Anderson Powerpoles on the other end of that cable. That way, when portable I have the maximum flexibility: I can either have a direct (but compact) power connection, or (in conjunction with an Anderson Powerpole splitter, such as the Powerwerx PS-4) power a couple of low-power accessories, like a tuner.

At the fixed station, I use the regular FT-897D power cable connected to a base power supply, and the FP-30 is switched off.

I tried the internal batteries, but in my opinion they were more trouble (and expensive) than they were worth. Only 20 watts, and when I used the FT-897D portable with the Yaesu batteries, they didn't have enough reserve to power the ATAS-120 through more than a few tuning cycles. If I really want battery power when portable, I haul along a couple of SLA (sealed lead acid) batteries. Last time I bought some (about five years ago), they were $32 for 18Ah each. A bit bulky/heavy for some portable operations, however, but at least full power.

28248. Re: [FT897] Voltage Drop

Yahoo group: FT897 (2009)
Date: 2009-11-09 11:00:21 UTC
From: DavidN
Topic: 28222 Message: 28248

My FT897 is in the car and wired directly to the battery with solid connections and with really thick cable. I get a voltage drop of 0.2v.

Make sure the power connection at the back of the rig is solid - try waggling it, and any other connections whil txing FM.....

.d. G4TUP/9H3CU.
P.S. I've read that apparently the negative connection shouldn't go direct to the battery but to a vehicle body connection as close to the battery as possible. With the former, if the battery to vehicle conection becomes loose, when you start the vehicle the huge current will go through the rig! Of course, if the negative line is fused that will blow, but how quickly?

Those settings are backwards...You should only use a Processor in the
rare occasion you can't get through...It may increase audio but distorts
the S's and T's and picks up background noise like an amp fan...

Wayne,

I have the FP-30 that came with the FT-897D that I bought second-hand and have had no problems at all with it. It keeps the power at a constant 13.8-14.0 Volts all the time. Would highly recommend getting it. I have had no problems with power supply noises or anything along those lines.

Subject: [FT897] FP-30 problems/comments?

Hello,

I hope the administrator deletes my previous post (from a few minutes ago) askin about the FP-30 internal power supply part number. As usual, I needed to do a bit more research before asking a dumb question, so if the question got thru intact anyway, I apologize for its obvious lack of knowledge and effort reflection on me. I thought I had looked enough, when obviously I had not.

At any rate, I am awaiting my FT-897D, and at the time I didnt persue the internal power supply option. Now I am seriously considering it. But at over $200, I am wondering if anyone can give me their experiences with it, good or bad. I like the idea of having everying in one package. The shack gets cable-itis enough the way it is... But if its weak or they have trouble, I would like to know.

I am reading the hundreds (almost 300) on eham.net for the 897 (initial variant) but have not read much about the internal supply... mostly complaints about battery cost and the like.

Thanks for the help.

Wayne, ke0ms

Hi all,

I have had this problem a few times now.

My radio will switch off and give a couple of beeps and then come back on as if I had done a full reset.

All programmed channels and settings reset back to factory default.

Luckily I have saved all my setting and memory channels in my laptop and it is just a matter of reloading them back in.

I have the FT Basic MMO program.

I look forward to hearing from anyone who has an answer to this problem.

Ray, VK3ACT

Steve,

The 12 meter band allocation is worldwide. A properly operating FT-897 (of any flavor, D or non-D) should operate from 24.890 to 24.990 MHz without having to wideband it.

That having been said, are you sure you are operating within those bounds? Also, is there the possibility that you may have "SPLIT" enabled that, although you are receiving in the 12 meter band you may be attempting to transmit outside of the normal amateur bands?

Mark (NM7L)

Hi Ray,
You never stated as to if this happens during TX only RX
only both ??
what bands HF, 6M only .... 2m,70cm only ?? or all of the above ?

HF and particularly 6M has been known to be a problem, with RF being
radiated
within the shack mainly due to antenna or coax installation problems ...
it can
cause all sorts of weird faults

If the radio is more than a few years old and maybe has been moved around a bit
some guys have discovered some of the PCB mounting screws have come loose
and that also can cause weird and wonderful probs.

If it happens in RX, then RF in the shack obv. isnt the cause and it may more
likely be the loose screw prob.

if during TX only, either RF prob or PSU prob. the PSU may be failing
on its
own intermittantly when under hi load. or.... if you are using a
switchmode PSU
there is the occassional one that doesnt like stray RF and can fail
intermittantly.
due to the earlier mentioned prob.... RF in the shack.

check all these things and let us know what / when the prob is happening :)

28257. FT-897 & LDG Z-100 Auto Tuner

Yahoo group: FT897 (2009)
Date: 2009-11-14 02:41:07 UTC
From: Donald
Topic: 28257 Message: 28257

Has any one experienced problems using the LDG Z-100 autotuner with the FT-897 ?

28258. Re: [FT897] FT-897 & LDG Z-100 Auto Tuner

Topic: 28257 Message: 28258

No problems at all. Although I've since switched to the AT-897 for
portability reasons.

28259. afsk level settings? digital gain: dots?

Yahoo group: FT897 (2009)
Date: 2009-11-14 14:42:20 UTC
From: marshallstax
Topic: 28259 Message: 28259

I'm trying to set the 897 for the ALC level - as stated in the manual - of: "seven to eight dots of indication on the ALC meter."

I'm in DIG mode, RTTY-L setting (menu 38)

Dots?? The "S9" meter, the horiz bar, with a bold vertical pip to indicate S9, is not marked in a way that indicates what is meant by "seven to eight dots of indication on the ALC meter" - unless, by "dots" they mean the vertical pips along the length to show signal strength.

The manual says to go to menu item 37 and adjust digital levels for "seven to eight dots of indication on the ALC meter" but you get about the same reading from around the default '50' level to all the way up to '100'

Anyone got any experience with this?

Z-100 works fine with my other icom and yaesu rigs. For some reason the Z-100 will flat not tune with the 897. Suspect the problem is with the radio and not the tuner. Also just noticed the radio does not want to go above 50w output.

Time to start digging inside with the golden screwdriver.

If you do the Ohm's law math, dig out an ohm meter, you might be able to find it by checking both the positive and negative power leads.

The instructions are a bit confusing. You should only just see the ALC lifting and no more for full output. It may be that the audio from your PC sound card is a little high so you could back that off a touch?
If you have a power meter you can use that as it helps.

Set the TX power to 40 Watts (maximum recommended continuous carrier for RTTY) reduce the audio level to 0 and then increase it until you just reach 40 watts output. That should correspond to the ALC meter just lifting.

That should give you a nice clean output on RTTY - same applies for PSK but you have to use the ALC meter for that as the level changes and a meter will only show the average..

I leave mine in all the time. If there is power connected to the back of the radio the batteries are not used. The main issue I have is that the batteries self drain so make sure they are fully charged if you are planning to use it in the field. I have since taken the batteries out and now just use a SLA battery and a 26 watt solar panel.

The jumpers are in an odd order, follow the markings on the board (silk screening) and either short or open them as required for whatever plan you want. Note that if you have a US radio all bandplans are effectively the same, so you can do MARS/CAP but you will not be able to get as much as you might for something that is sold only in a different market.

After doing the jumper changes you have to do a reset of the radio so that the firmware will recheck their state and repopulate the variables. This should be documented in whatever guide you are following.

to add to this, if you turn the radio on when there is no external DC
applied it will use the batteries. You can tell if its using external
DC or if it is using internal batteries by the icon on the display which
looks like a "AA" battery.

Mine does not fail gracefully, what it does is it goes to "sleep". This means that its not really off, its like turning it off via CAT. The internal batteries run the radio, and reapplying the external DC will wake the radio up. I can press the blue power button and it will come on though. I do not believe there is a setting that will allow it to fail gracefully to the batteries. However as soon as the external DC comes on it will switch to that.

If someone has found a way to make it fail over automagically to the batteries I would love to hear about it, but I personally havent found anything and did not see anything in the manual about this.

28276. FT897 as remote base

Yahoo group: FT897 (2009)
Date: 2009-11-16 12:56:06 UTC
From: Ron
Topic: 28276 Message: 28276

I posted this last week but I never saw it appear, so if this is a repeat please excuse me, maybe we don't get our own posts. This is my first try at posting. I have learned a lot from reading others' posts.

I would like to be able to use the radio installed at home from various internet connected places. It looks as if a program like HRD can give me that if I 'remote desktop' into the computer hooked up to the radio. The question I have concerns audio in and out. Can one of the sound card interface boxes be used for voice on SSB and/or FM?

If you have this working I'd like to learn from your experience.

Thanks
Ron N4AJT

28279. ft-897 signalink users that use rj45 for transmitting

Yahoo group: FT897 (2009)
Date: 2009-11-16 20:25:30 UTC
From: gbongi1
Topic: 28279 Message: 28279

Hi folks ki5lui here.

My current set up is:
ft 897.
Munu set to psk-U
Vox off

hamstick antenna.
Signalink USB

Radio

I use rj45 to connect form signalink to the rj-45 connected directly to the mic jack (not data jack)

I have tried digipan on Windows XP and fldigi on Linux (debian) with the same exact result.

I can receive fine. When I transmit though no power is going out.
The ptt comes on but it seems that no sound is getting transmitted at all.
I can hear the transmission through the Signalink "monitor"

I have double and triple checked the jumpers. Also the rj-45 connection.

I called tigertronics and they say everything seems to be hooked up right and that it must be the mic connection or the radio is not configured correctly.

Is there anyone set up the way I am?

the next step i was going to do was to order a 6 pin din from tigertronics.

Thanks a lot for any help.
73

Guys:

Just curious about something. If you have an LDG Z-100 autotuner would you mind unplugging both the power and radio interface connections from the back of the tuner and compare the recieve noise level to what you have with those cables plugged in. Extra points for trying this on several bands. You have to unplug the cables from the tuner rather than the radio for this to be valid.

I have an 897 with a SignaLinkUSB. However, I connect from the Signalink rj45 to the 6 pin data jack in the back and use digital for the mode. Works perfect. I think this is the way tigertronics tells you to set it up (I called them direct to order the unit and that was the cabling method they recommended to me.) I am not certain, but I do not believe the SignaLink has the necessary circuitry to perform the keying function via the RJ45 mic jack.

28283. Re: hard mod widebanding

Yahoo group: FT897 (2009)
Date: 2009-11-16 22:17:50 UTC
From: MichaelE
Topic: 28267 Message: 28283

Here is what I know about jumpering the FT-897D to wideband the rig. There are for sure at least two different jumper schemes on the internet if you search for them. There are at least three differnet versions of FT-897D. My rig does not match either of the two published. (If your rig existing jumpers do not match what is in the mod exactly, don't change anything. I made the mod and had to undo it becasue my rig was cut to a choice of 5 or 10 watts of power after modifying). I called Yaesu and talked to their tech folks. Unless you can prove you are authorized to transmit on the wideband frequencies they wil not give out the mod information. I am a licensed MARS operator and am authorized to operate on the frequencies but they will not provide the mod info until I send them my license. And then they mail it to the requestor and that person is not allowed to give it out to anyone else due to FCC restrictions. All this is per Yaesu.

Mike, AE8U

Subject: [FT897] ft-897 signalink users that use rj45 for transmitting

Hi folks ki5lui here.

My current set up is:
ft 897.
Munu set to psk-U
Vox off

hamstick antenna.
Signalink USB

Radio

I use rj45 to connect form signalink to the rj-45 connected directly to the mic jack (not data jack)

I have tried digipan on Windows XP and fldigi on Linux (debian) with the same exact result.

I can receive fine. When I transmit though no power is going out.
The ptt comes on but it seems that no sound is getting transmitted at all.
I can hear the transmission through the Signalink "monitor"

I have double and triple checked the jumpers. Also the rj-45 connection.

I called tigertronics and they say everything seems to be hooked up right and that it must be the mic connection or the radio is not configured correctly.

Is there anyone set up the way I am?

the next step i was going to do was to order a 6 pin din from tigertronics.

Thanks a lot for any help.

Hi Nelson,

The radio will only put out 20W when it is running on the internal battery.
It's designed that way. You must use the power supply or external 13.8v to
get full 100W power.

BTW, please sign your messages with name and callsign.

[Sent this on the 15th but it never showed up on the archives,
so I'm re-sending]

> Some time ago I asked about how to replace the driver MOSFETs
> on the main board (top) as mine were blown by a previous owner.

I said I'd report back when I had more info.
In short: the radio works now!

Here are some lessons learned:
- This is a lot 12 radio with 2SK2975 FETs, which are *not interchangable*
with the newer RD07MVS1. With the newer FETs, gain of the driver stage
on 70cm was abmysmal (on lower bands it was OK, on 2m fair),
with the 2SK's it was easy to get the ~8W drive on the
"red" cable between the top and bottom board
- Replacing the 2SK2975's was very difficult. It is hard to create enough
heat to wet the solder on the copper pads below the source of the FETs.
I ended up making a "mechanically flat" connection
without actually soldering the FETs to the cool block and while cooling
is not as good as it was before, the FETs don't run very hot
so I'm chancing this for now.
- Another problem was that receiver sensitivity was ~10 dB down on
most bands, up to ~20dB om 2m. After a lot of head scratching I found
that the band switch diode D3013 (both halves) had shorted,
biasing the whole switch fabric of D3011, D3012, D3014, D3050,
D3053, and D3100.
One of the syptoms was that sensitivity would be significantly better
when the voltage was decreased to 9V, because less faulty bias current
would be available (check schematics).
I replaced the diode and sensitivity was fine.
BTW, repairs was a little complex because the switch circuitry had
lot-69+ mods done on them (from the factory), which were blocking access
to some of the components I wanted to measure on.
- Finally, the rig would signal "SWR high" on VHF/UHF even though the
SWR meter in the rig would hardly show any signal.
After convincing myself that there was no faulty circuitry, I decided
to re-align the SWR bridge (trimmers) as wel as software adjustment
(service mode). While the trimmers were OK, the software settings
were way off and I suspect someone tried to "repair" things
(or create more output) by fiddling with these settings.
This isn't the first time and frankly, I sometimes wish that these
settings are less easily accessible because of the "golden screwdriver"
effect.

All in all, it was an interesting experience, I learned a lot.
While it may not be feasible economically (price of the rig was

~5dB down compared to regular second hand price, and EUR 50,- in parts),
I'm happy I did this just for the experience.

I'd like to thank YAESU for making manuals and parts easily available
to tinkerers like me.

73,

Geert Jan PE1HZG

28289. Re: S-METER trouble on 2m and 70cm

> 73 to the list , l recently bought a ft 897 in second hand,
> all seems to be ok unless in 2m and 70cm the s meter is always
> indicated S4 level no more also with a local strong signal ..

Can you please be more specific:
1. Is this problem perhaps only with FM vs SSB?
What does the radio do when you do FM on 3.600 MHz?
2. What is the readout when there is no signal, on HF, 2m, 70cm?
3. What is the readout with a strong signal on HF, 2m, 70cm?
4. Have you verified receiver sensitivity and is it on spec on all
the bands (check all HF bands, 6m, 2m, 70cm)
5. When you remove the green cable and directly inject the antenna signal
on the main board (on top), is sensitivity on spec?
(by injecting here you circumvent a lot of switching/filtering
circuitry on the PA board on the bottom)
6. What's the setting of menu#80 (SQ/RF gain)

The error you describe is not 6kHz, but around 60Hz. I would think that
this will be within the spec of the FT-897. To seriously improve on this,
I would recommend checking the frequency at 70cm and carrying out
frequency alignment as per the service manual.

You will need seriously accurate test equipment to do this, certified
traceable to national or international standards. I use a GPSDO standard
for this sort of work.

Of course, at that level of error, you might be right and your friends be
wrong. The most likely is that you are all off frequency.

Geoff

EI4HX
thanks for the response.
This is how I am configured right now.
I will look further into menu 48 and the other menus to see what I might have wrong.

menu 1 = ext on
menu 16 = Car LSB T is 0Hz
menu 18 = Car usb T is 0 Hz
menu 19 = Cat Rate 38400 (Rig control works fine)
Menu 20 = CAT
menu 21 = CLAR
menu 36 = Dig Disp 0Hz
Menu 37 = Dig gain 25
Menu 38 = User-U (also have tried PSK-U)
menu 39 = Dig shift 0Hz
menu 40 = Dig Vox 0
Menu 48 = Disp Mic EQ OFF
menu 59 = Mic Sel CAT
menu 61 = PWR
menu 71 = pkt 1200 50
menu 72 = pkt 9600 51
menu 75 = RF power set 10
menu 86 = CFIL
menu 87 = Vox delay 500ms

Thanks anyone for any help in advanced

I have the same basic setup that you do -- FT-897D, Signalink USB, and connected from the rj45 mike port on the rig to the RJ45 "radio" port on the Signalink. You also have to run a monaural (2 conductor) audio cable from the speaker jack or headphone jack on the radio to the "speaker" jack on the Signalink, since the mike jack does not provide receive audio through the RJ45 port.

Signalink instructions say to set the rig to SSB (USB, even on 40 meters, in most cases) rather than digital mode. Have you tried that?

Is your transmitter red light coming on when the software sends out a signal? If not, then it looks like a problem in the PTT connections. I would suggest that you recheck the jumper settings inside the Signalink. Per the Signalink user instructions, you should have the following jumpers set:

Pin-out
Pin 1 ? N/C
Pin 2 ? N/C
Pin 3 ? N/C
Pin 4 ? Mic GND
Pin 5 ? Mic
Pin 6 ? PTT
Pin 7 ? GND
Pin 8 ? N/C

Note that these are DIFFERENT settings than you use if you are connecting through the 6-pin port on the back of the rig..

With this setup, all you should have to do is adjust the transmit modulation level either through the Signalink transmit volume knob or the FT897 SSB Mike Gain control, or both. The ideal, according to Yaesu documentation, is for the ALC meter to register about 7 or 8 dots, which is just shy of the longer bar that sits at the "10th dot" position on the ALC meter.

With this configuration, the Signalink does not use VOX for control of transmit, so VOX menu settings are irrelevant.

You do want to make sure that your software is configured to use PTT and not VOX to key transmit.

good luck,

Lew K6LMP

Yes the red light is illuminating.

I have re-examined the jumpers three times and twice with my elmer and once with tech support.

I double checked the speaker to speaker connection and noticed that mine is something I spliced together and am going to take a closer look at.

I have been using USB for Digi

It is doing everything like it should be transmitting. However, no power or modulation.

I will double check that speaker cable though.

Thanks for the input.

OK, one more thing to look at:

I'm a Mac OS X user, so I can't tell you exactly what to look for in Windows settings, but I can tell you the Mac equivalent.

On the Mac, you can set various ports or devices as both sound input and output using the System Preferences:Sound panel.. On the Mac, the default input and output are the internal speakers and built-in mike in my laptop. To make the digital software work, I have to go into both the system preferences settings and the digital software settings and tell both of them to use the Signalink as the input and output sound sources. If I don't do that, nothing works.

I think you would select this in the Control Panel in Windows, but somebody who has more experience with Windows can tell you a lot more than I can about that aspect of the setup.

I do know that it took some head scratching for me to get it all worked out with OS X, and in general it's easier to set up than Windows.

28298. Re: [FT897] ft-897 signalink users that use rj45 for transmitting

Yahoo group: FT897 (2009)
Date: 2009-11-18 03:04:50 UTC
From: gbongi1@comcast.net
Topic: 28279 Message: 28298

I am actually currently hooked in Debian Linux and have it set to USB audio (signalink)

I will see where I can get with MAC osx but I feel I will get to the same point.

Thanks for the info.

George

OK, one more thing to look at:

I'm a Mac OS X user, so I can't tell you exactly what to look for in Windows settings, but I can tell you the Mac equivalent.

On the Mac, you can set various ports or devices as both sound input and output using the System Preferences:Sound panel.. On the Mac, the default input and output are the internal speakers and built-in mike in my laptop. To make the digital software work, I have to go into both the system preferences settings and the digital software settings and tell both of them to use the Signalink as the input and output sound sources. If I don't do that, nothing works.

I think you would select this in the Control Panel in Windows, but somebody who has more experience with Windows can tell you a lot more than I can about that aspect of the setup.

I do know that it took some head scratching for me to get it all worked out with OS X, and in general it's easier to set up than Windows.

> I have the same basic setup that you do -- FT-897D, Signalink USB, and connected from the rj45 mike port on the rig to the RJ45 "radio" port on the Signalink. You also have to run a monaural (2 conductor) audio cable from the speaker jack or headphone jack on the radio to the "speaker" jack on the Signalink, since the mike jack does not provide receive audio through the RJ45 port.
>

28299. Software for Digital Voice Keying

Yahoo group: FT897 (2009)
Date: 2009-11-18 03:10:38 UTC
From: Jeremy Dunman
Topic: 28299 Message: 28299

As I get ready for this weekend's contest I am wondering if anyone can recommend any software that works with the FT897 for us as a Digital Voice Keyer. The KD4UDY software worked like a champ but unfortunately I can't register it any more as KD4UDY is now SK. This is the only software I have found so far that will work.

I am running a NOMIC connector to the radio's digital port and don't want to have to foot the bill for anything else if it is at all possible. Thank you and I appreciate your assistance on this one.

WinWarbler includes a digital voice keyer. Its free, and available via

www.dxlabsuite.com

73,

Dave, AA6YQ

Try changing the setting menu 59 = Mic Sel CAT to normal. I don't think you set the mike setting for CAT for this application, only for rig control through the mike cable. Hope this helps.

I use the data socket which works well, and should also work for that person asking about voice. The only think I've noted with it is that you have to have the "CW Auto" menu setting off.

Do you have to use the resistor capacitor combination when using the mic socket, or does it have a separate PTT line?

That is correct, you don't need CAT, but it should't make any difference. putting the mike jack in CAT MODE changes pin 1 and pin 2 from UP and DOWN to DATA IN and DATA OUT. otherwise the pin functions are unchanged. MIC, MIC GND, and PTT are the same either way, and those would be the relevant pins.

28305. Re: [FT897] ft-897 signalink users that use rj45 for transmitting

Yahoo group: FT897 (2009)
Date: 2009-11-18 16:21:31 UTC
From: George
Topic: 28279 Message: 28305

I might be having to get that data cable ($24 shipped.)

I will check the CW setting.

I don't use a resistor cap when using that mic I don't really know if
I should be or not either.

I suspect the ptt line to be in the rj45 the ptt does seem to work.

I would also add that I use the CAT cable for rig control and the mic
cable for signalink only.
Could that be an issue?

28306. New poll for FT897

Yahoo group: FT897 (2009)
Date: 2009-11-19 02:13:25 UTC
From: FT897@yahoogroups.com
Topic: 137 Message: 28306

Enter your vote today! A new poll has been created for the
FT897 group:

What would be the mobile antenna that you would like to TRY for one day on your vehicle?

o Tarheel Antennas
o Yaesu ATAS-120
o High Sierra Sidekick
o CHAMELEON V1 HF Multiband Antenna?

To vote, please visit the following web page:
http://groups.yahoo.com/group/FT897/surveys?id=12963519

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

I have a suggestion. Look very closely at the SignaLink manual (or website) for your jumper settings. If you look closely you will find the 897 appear to be listed twice. You probablyused the first one you came to which is actually for the FT-897 (not the FT-897D).

The only way I found to tell them apart is that the one for the 897 references an 8 pin DIN data jack and the one for the 897D references a 6 pin DIN data jack.

Since the 897 has an 8 pin it has a jumper on pin 7 (as noted below), The 897D does not have a pin 7 so there are no jumpers on pin 7.

I learned this the hard way - my rig did not operate intitally. But after a lot of further investigation I discovered the error of my ways.

28308. Re: [FT897] Re: ft-897 signalink users that use rj45 for transmitting

Yahoo group: FT897 (2009)
Date: 2009-11-19 03:09:29 UTC
From: gbongi1@comcast.net
Topic: 28279 Message: 28308

I am using the rj45 connection snd did not see any other jumper setting schematic for it.

http://www.tigertronics.com/sl_wirebm.htm#YAESU

I am going by

" RJ-45 Mic Connector (use SLUSBRJ4, SL1+RJ45, SL1-RJ45 or SLCABRJ4)"

the secind schematic that shows the Jumper settings.

Thanks for your help

George

Just confirmed still not working.

There is somethign I am missing.

Everything simulates as though I am transmitting I just don't get power or modulation.

Is there anyone with this same set up?

Try changing the setting menu 59 = Mic Sel CAT to normal. I don't think you set the mike setting for CAT for this application, only for rig control through the mike cable. Hope this helps.

28310. current post comment

Yahoo group: FT897 (2009)
Date: 2009-11-19 13:31:37 UTC
From: ke0ms
Topic: 28310 Message: 28310

Slightly off-topic, but since the post was started by someone else, I'll comment; I own a TARHEEL 200A antenna and I absolutely love it. I get thru almost always on the first or second call, and am continously given great signal reports, especially when they know I'm running mobile.

I have even considered using a tarheel for my FT-897D home station, but have decided to go the more traditional vertical and wire antenna selection. I am interested in hearing about other home antenna setups that seem to work really well with your 897s... especially anecdotes about use of an LDG AT100-Pro, which I also have but have not yet gotten installed. I just got my 897D two weeks ago, but have been moving so only listen with a wire dangling from my garage rafters...

You can see my mobile Tarheel setup on qrz.com. I'm interested in the poll results.

Well I voted where I should, but I would like to comment on the epoll itself. I have the ATAS120 already. I think the poll might have asked the question in a way that reflected whether or not you all ready had a screwdriver style mobile antenna.

If ten people answered the question but they all ready had the ATAS120 (for example) they prolly wouldn't answer with that antenna. The poll results would be biassed. I can't think of a simple way to word a question to reflect such a situation, but I think it's relevant.

I would like to try the Tarheel for comparisons but that's only because I already have a screwdriver I'm happy with. Otherwise I would pick the Yaesu.

Subject: [FT897] Software for Digital Voice Keying

As I get ready for this weekend's contest I am wondering if anyone can recommend any software that works with the FT897 for us as a Digital Voice Keyer. The KD4UDY software worked like a champ but unfortunately I can't register it any more as KD4UDY is now SK. This is the only software I have found so far that will work.

I am running a NOMIC connector to the radio's digital port and don't want to have to foot the bill for anything else if it is at all possible. Thank you and I appreciate your assistance on this one.

GCVoice Keyer

Looks like website is down right now. It's freeware so maybe someone has a copy or you could e-mail the author of the program and see if he could send it to you in e-mail or something. Do a google search for it.

Dave, I have tried to get WinWarbler to work with the FT-897 with mixed results, I asked a while back on the DXlab Reflector and was told that it doesn't support the FT897 and a nomic. Any suggestions? ;)

Here at home I'm using a Carolina Windom 80 that has the center hung in
a tree about 30 feet up and the end droop to a shallow "V". With the LDG
100 it works 10 - 80 ham and MARS and occasionally does an exceptional
job best so far was New Zealand on 20M SSB.

28321. S-meter scale images for DIY external meter

Yahoo group: FT897 (2009)
Date: 2009-11-19 00:53:49 UTC
From: David
Topic: 28321 Message: 28321

I have a nice meter that I want to use as an external s-meter with my ft897. I'm sure that in the past I have seen lots of images download and print out for use as scales on DIY external meters.

The problem is that I can't remember where I have seen them. I thought it was in this group but, as I can't find any here, I'm wondering if I imagined it.

Can anyone please help me?

Thanks

It is my understanding that shorting pin 2 (PTT) on the data jack to ground should trigger the transmit mechanism, but I haven't actually tried it. See page 18 of the manual for pinouts on the data jack.

Bo:

This should be the indication for the "Dual Watch" feature in which the radio periodically checks an alternate frequency. See pages 15, 49, and 50 in the operating manual for more information. It is, however, not a simultaneous "dual receive" function as is found in some other units.

Who starts these polls and why???? Is this some sort of back-handed way of getting some exposure for the Chameleon? I'd never heard of it, but a similar poll just popped up on the FT-817 reflector, with different choices, except for the Chameleon! Besides, there are so many other choices out there. How was this short list developed?

28332. DIY S-meter images

Yahoo group: FT897 (2009)
Date: 2009-11-21 14:45:34 UTC
From: Lup S. DJ7SW
Topic: 28319 Message: 28332

Nice Meter scales can be copied from OK2FJ page here:

http://www.radio-foto.net/radio/ftmeter.php

a nice pgm called galva by F5BU can be used for selfmade ops.
Download it frm TK5EPs page:

http://tk5ep.free.fr/tech/abaqueROS/en/gainchart.php

Tonne software: http://www.tonnesoftware.com/meter2.html

offers the ur-version of all those pgms.

a note: pls look for an elmer who can teach you the magics of
goggling or yahooing.

From: Lup S. DJ7SW
Topic: 28319 Message: 28333

Sorry

i forgot another nice page. If you own a calibrated signal souce
or a good db attenuator you can produce exact calculated instrument dials:

http://www.s-meter.de/index.htm

sorry in german and no (god heavens) imperial units. (;-))

28335. FT 897-D High SWR

Yahoo group: FT897 (2009)
Date: 2009-11-20 22:22:22 UTC
From: camtn913
Topic: 28335 Message: 28335

Hello group, this is my first post to the group. I have a problem with HF part of my radio, UHF/VHF are fine, but HF SWR is very high and I can't tune with the LDG AT897 tuner. The antenna was checked with an analizer and is not far out of tune. I tried to tune with another tuner with the same results. I hope someone will beable to give me some idea as to the problem. 73 DE KG4RYJ Carl

28336. XVTR option and automatic xverter switching

Yahoo group: FT897 (2009)
Date: 2009-11-21 15:49:18 UTC
From: Rami
Topic: 28336 Message: 28336

There is nice option when XVTR is selected to A/B. Output of Q1010 pin11 (TP1024) is high when B is selected and pin12 (TP1023) is high when A is selected.

Well both rigs have their own issues..

FT-450 has FSK input and a nice IF disp so no filters are needed but you can only go down to 500Hz bandwidth which doesn't cut it for RTTY and on PSK31 its nice to go down to 100Hz, also no VHF/UHF is you wanted to do that. Oh and that teeny-weeny tuning knob..

The FT-897 has no FSK input so on RTTY you need to drive it with tones. And to Run RTTY PSK you need to fit a 300hz filter (The Inrad one is excellent) but of course costs a bit and is fixed..

I have 2 FT-897s for VHF 2M/6M on one and 70CM + transverter to 70Mhz on the other, I take one on field day for HF as its just built to go portable!

If VHF isn't important to you and digital modes your thing I would save a bit more and Get the FT-950 but that just my opinion..

28340. Advice needed for CW operation...

Yahoo group: FT897 (2009)
Date: 2009-11-22 11:38:43 UTC
From: kerryguy7
Topic: 28340 Message: 28340

OK, I hope this question isn't too dumb BUT, keep in mind that I'm still a pretty new 897 owner as well as being a fairly new ham.
With that in mind, here is my question, or, in actuality, "questions."
I am in the process of learning the code. I want to attach a good "straight key" to my 897D. I am a bit confused with the instructions in the owner's manual. What, in your more experienced opinion, is a good key to use? (I have been looking at the Bencher straight key as well as the Vibroplex straight key BUT, well, as I understand it the 897 needs a "stero" plug for hookup...correct? It looks as though BOTH of these keys are only available with a "mono" plug. I might be wrong about this, however...
Second question: Once I have the proper key hooked up to the 897, can I use the sidetone feature of the rig to practice sending code WITHOUT transmitting on the air? If so, how do I set this up?
Like I said folks, these questions might seem pretty basic BUT,hey, we all are in the process of learning, right? Some of us, however, are learning at at more basic level than some others! :)
Thanks in advance for your help with these questions!

28341. Re: Which ?

Yahoo group: FT897 (2009)
Date: 2009-11-22 12:08:25 UTC
From: willgord
Topic: 28337 Message: 28341

I faced the same choice and opted for the 897. Felt Yaesu had made too many compromises to get the price of the 450 down to about $800 with built-in tuner.

I use my 897 as my home base station--using a screwdriver antenna inside a New York City apartment with a counterpoise hanging out the window. As it happens, I also get to use the 450, with outdoor dipole, at my local Red Cross chapter.

After using both, I believe the 897 is the better rig, with more features built in. I basically work 20 meter phone and am just getting into PSK31. Have no complaints about having chosen the 897. Have workred about 60 countries and 38 states on phone and after two weeks with PSK 31, have worked nine countries and 10 states.

That said, I feel that it is only a matter of time before I add a 950 to my shack. That strikes me as a nice upgrade to either the 897 or the 450. I had intended to use the 897 portable in Central Park, which is only a block away. In fact, I have never done so. At home I can operate 100 watts from the 14th floor (giving me what amounts to a 120 foot tower). In Central Park I swould be running 20 watts at ground level.

My choice would be the 897D, unless you can swing a 950. It is $500 more than the 897 but probablhy worth the diff. For the record, I work VHF-UHF with a Yaesu 7800, which I use as a base station. That has a 27-inch dual band whip mag-mounted to an air conditioner outside the window. I amuse other hams by referring to my 27-inch whip as my tower.

73s and best of luck with your choice

One possible low tech cause.

I had a similar problem on mine when I first bought it and found that the fuse terminals in the little plastic box external to the rig weren't crimped right, with the result that every once in a while it would lose connection for a brief instant. Two seconds with a pair of pliers fixed that.

You said you checked your antenna with an analyzer. There are several questions that need to be answered. What kind of readings did you get with the analyzer? What type of antenna are you trying to use? Will the radio not tune on any HE band? What does the analyzer show on the same band's) that you get High SIR indications on your rig? Have you double checked your connections between your rig and tuner? Does the tuner "try" to tune? In other words, you're sure the tuner is getting power, right? The AT-897 will tune up to a 10:1 mismatch. If your antenna is out more than that, even if you could get the radio happy (SIR match), the antenna isn't going to resonate much.

Give the group some more details and maybe we can offer some assistance.

Rick,

When tuning in a CW station press and hold the "HOME" button. This will produce a tone that you can zero beat with the received signal by tuning the VFO. When they are the same tone the CW-T light should be on. If not then something may be off. Also, unlike an old Kenwood of mine, the frequency display in CW reads the actual carrier frequency when tuned to a note. In other words, if you were to tune in WWV to a zero beat of say 600 Hz (where the CW-T light comes on) the display will read 10.000.00, not 10.000.60.

You can also adjust the zero beat CW pitch to your liking with menu # 027 CW PITCH.

Hi Tom,

You can use a mono 1/8" plug in the key jack with no problems. You just have to disable the keyer by pushing the C key (KYR) in Menu Function J (MFj). In the same menu you can push B (BK) to disable the transmitter. In Menu Mode No. 031 you can have the rig send CW practice (off air) to you and show you what it sent afterwards.

From: Richard Corfield
Topic: 28344 Message: 28349

It should track your sidetone frequency setting. Any chance you can use another radio to test it? I don't know how accurate you have to be to get it to light up, but when you transmit then your tone should be at the same frequency (or close enough) as the person sending. A second radio in your shack can test that.

I think even if you use the "Transmit Morse when in SSB mode" feature it will shift the tuning by the right amount to get things to line up. Your ssb carrier point will be offset by whatever your sidetone frequency is.

Hi,
My 2 cents worth... I have both a 950 and 897D and to be honest, If I had purchased the 897D first (instead of the 950) I would have only bought the 897D.

By the time I had added the deluxe Yaesu hand mic, SSB and CW filters and the internal power supply to the rig it is about the same money as the 950. These extras are worth it!

Performance for me is roughly the same on both rigs as far as RX goes and on top of that one gets multi mode V/UHF and a number of other listenable frequencies in the V/UHF region. The 950 has a lot of pluses going for it too but if money is tight then my choice is the 897D over the 450.

I suppose if I had wanted a super hone rig then I could have thrown a big wad of $$$ at a top of the line Yaesu or something else but I personally don't see the need since both the 897D and 950 are so much better than the older rigs I used to run.... "beauty is in the eye of the beholder" ;-)

From: kybarney
Topic: 28354 Message: 28354

Hello,

I sent my FT 897D in for repair about 6 months ago. I smelled smoke when I was tuning up so I sent it for repair as it was not putting out 100 watts.

My question is I have not used VHF/UHF in a very long time. I just bought a "back of radio" fold up antenna from MFJ. I connected it to the correct antenna jack. Anyway, it has a very high SWR and I cannot hit the local repeat with it, but I can hit it with my HT. I have the external FT meter and it shows I am putting out 100 watts on HF, 50 watts on 2 meters, but only 12 watts on UHF.

Can VHF/HF put out maxiumum wattage, and UHF not be putting out max power? Or, if VHF/HF are putting out max output, would UHF also be putting out max output? Just wondering if UHF is broken or if the antenna doesn't work. (The antenna has a high SWR).

FYI, the FT meter says I am putting out max power but I cannot hit the local repeater due to hight SWR on the antenna, using 10-20 watts. I only have the FT meter, and not a wattmeter that plugs into the back of the radio.

Thanks for any input.
Kyle

28355. Duplicate bands

Joe,

I bet you it doesn't have 2 80-meter bands! Actually, if you look at the frequencies I suspect that one of those freqs is outside of the 3.500 - 4.000 MHz 80-meter range, making it a General Coverage Band frequency. The General Coverage band "floats" depending on where it was last, meaning it can show up at any point between the ham bands.

The only problem is that NiMH batteries have a fairly high self discharge rate. Sometimes I go a month or longer without using the batteries. I doubt that the OEM batteries are the newer low self discharge cells. I have read that they can loose up to 20% of their charge in the first 24 hours after charging.

28358. SDR software audio interfacing

Yahoo group: FT897 (2009)
Date: 2009-11-24 10:40:18 UTC
From: m0els
Topic: 28358 Message: 28358

Hi all, I am having problems with the uadio on sdr software, where the audio bandwidth displayed is too narrow and I get the "mc donalds M" effect.
The signals are on top of the M.
Has any managed to interface the 897d to sdr software and how was it done. Are there diagrams available as I would like to modify my rig.

Thanks

John

ps. I uploaded a screengrab to the files section

From: NM7L
Topic: 28355 Message: 28360

Joe,

OK - same scenario. I looked at the manual, page 20, and there are 4 receive only band positions associated with the FT-897: 5 MHz (perhaps associated with the Alaska 5.167 MHz emergency frequency), 15 MHz (WWV), 88 MHz (FM BC), & 108 MHz (Aircraft Band). The 15 MHz position also functions as your "floating" General Coverage band, and will display any frequency not otherwise covered by the amateur band selections.

If you have a FT-897D your 60-meter transmit channel frequencies are available via the memories.

Hope that helps.

Hi John,

I built a 455kc to 12kc downconverter and coupled it to an open filter slot in my 897D and ran the 12kc output of the downconverter to my soundcard. That allowed me to utilize the Flex Radio PowerSDR software with the 897D for receive purposes. It worked extremely well for listening in all modes. Are you tapping the IF before or after the filter chain? Your screenshot looks like you might be coupling after the sideband filter rather than in front of it.

fair enough, wasnt sure how that did that. It should also be mentioned
that this is referring to a US version since other regional bandplans
will have different things going on, some may allow it. I just did not
recall since I almost immediately modified mine upon getting it, and
manually programmed in the channels. Thanks.

28368. Re: Power Output Question

Yahoo group: FT897 (2009)
Date: 2009-11-25 17:05:16 UTC
From: john_kb0ne
Topic: 28354 Message: 28368

Basically , If you are having SWR problems then the transmitter will usually try to protect itself and "fold back". So in other words, if the transmitter sees a high returned wattage (SWR) then it should shut down to a point where there is a minimal amount of power being present; that maintains the fold back mode. This will keep the finals from cooking themselves instantly. Power indication on the meter won't necessarily mean that ANY is getting to the antenna.

John KB0NE

From: W1AEX
Topic: 28358 Message: 28370

Hi David,

It consisted of an oscillator running at 1.776mHz with a divider that produced 466kHz which was run into a mixer to produce the 11kHz difference to feed into the soundcard. The design was based upon the KE1GF circuit that has been floating around.

It was very cheap to build and the layout is not critical at all. The schematic and a couple of pictures, including a screenshot showing the output of the 897D running PowerSDR, can be seen at the links below. The 897D optional filter slots make an excellent place to non-destructively pick off the 455kHz IF through a small value capacitor.

The only issue I experienced was a ground loop that showed up between the downconverter and the 897D which produced a slight amount of audible 60 cycle hum in the audio output. It was easily resolved by winding a simple 1:1 transformer (Pri-10T, Sec-10T on a small mix 43 core) between the two units, which can be seen as a small black box in the second image below.

http://members.cox.net/ender/schematic.jpg
http://members.cox.net/ender/sdrlayout.jpg
http://members.cox.net/ender/sdr.jpg

The 897D made a nice front end for the project, and it was fun having a scope, panadapter, waterfall display on the computer to amuse myself with as I was tuning around.

28371. Re: SDR IF tap

Yahoo group: FT897 (2009)
Date: 2009-11-26 04:10:50 UTC
From: W1AEX
Topic: 28369 Message: 28371

Hi John,

I picked it off at the optional filter position offered by the pins at J23 and J24. If you jumper the first two pins at J24, that tricks the 897D into thinking there is a filter installed in that slot. I ran a 100pf cap from pin one of J23 to the remaining pin at J24 to allow a very wide bandwidth when that position was selected. Don't use that filter position to transmit with, unless you are interested in running double side band ESSB! The pictures at the links below will give you an idea. For more details about tapping the IF, go to the files section of this group, and download the excellent article by Andreas (DF1PAW) and Kord (DF1PW) "DRM Modification - FT-897". I simply ran the IF output through the space between the data output jack and the rig's back panel. There's plenty of room there.

The conversion from 455kHz to 12kHz allows you to feed the output of the downconverter into a computer soundcard input, which then allows the Flex Radio PowerSDR software to act as an IF receiver with the 897D functioning as a tunable front end. It gives you most of the receive features of a Flex Radio, including modes, custom bandwidths, and all the scope features. The biggest limitation is that the bandspread on the panadapter scope is not as wide as an actual Flex Radio.

A lot of guys do this project by purchasing a SoftRock receiver kit that is set up for 455kc reception. It works very well, but you need to be prepared to work with surface mount components if you go in that direction.

The pictures below show my IF tap point and a way to run the cable through the back panel in a non-destructive way.

73,

Rob W1AEX

I agree with Mike,kc9ipv;

Most NiMh batteries do not have the shelf life that we were accustomed
to with alkaline or the old NiCad batteries.
A lot of digital camera users have discovered this.

That being said,I am very happy with the internal NiMh battery packs
that I use in my FT897D.Great way to go portable,without having to drag
along
external battery packs.

Topic: 28374 Message: 28374

Hi guys,

When I first purchased my rig, the S meter was working quite well.

I think I have mucked around with a setting some where in the menu system as the S Meter never changes once I have adjusted the gain to where I want it.

If I leave the RF gain dial where I want it. The S meter will give me a reading, but it doesnt change regardless of the signal received.

I can have a QSO bellowing in but the S meter will remain exactly where I set it via the gain dial.

Is there a setting I have played with by mistake ???

From: W M W
Topic: 28376 Message: 28376

I believe I understand correctly that there is no head separation accessory for the FT-897D like there is for the FT-8900R (I have both radios). In a mobile application, can the FT-897D be mounted remotely, such as under the back seat, and operated successfully with the optional Yaesu MH-59A8J microphone? Or, must it be mounted in the vehicle so that the operator has fingertip access to the front panel controls?

I plan to keep the FT-8900R in the vehicle most of the time, but I would like to have the Yaesu MMB-80 mobile mounting bracket installed my Chevy Avalanche so I can take the FT-897D from the shack and drop it into the vehicle when I go on trips. I would also appreciate any insights from others who have experience installing these radios (and antennae) in the Avalanche. The space under the back seat (either side) seems to have plenty of room for the FT-8900R to be bolted to the floor. Can anyone tell me how much vertical clearance the FT-897D would require when bolted in the same location, adjacent to the FT-8900R's mounting bracket (assuming, of course, that the FT-897D can be operated remotely with the MH-59A8J microphone at all!)?

Thanks in advance for any assistance that can be offered.

28380. CABLE

Yahoo group: FT897 (2009)
Date: 2009-11-26 12:12:09 UTC
From: bragucci
Topic: 28380 Message: 28380

First- Happy Holidays!
Now, my question. I want to try data mode operation, such as PSK31. I also downloaded the Ham Radio Deluxe software. What cable will I need to use HRD and PSK31? Is it the same cable for both? Two different cables? Where would it plug into the back of the radio? The same place for both HRD and PSK31 or a different place for each function. I've used a Kenwood TS820 for years and this new high tech radio stumps me at times. But on another note it is a nice radio. It really does it all. In fact I told my wife if this radio could be programmed to cook dinner she'd be out the door.
Thx to all

Bart

Ho Rob, Thanks for the info and pics. I am going to tackle this and will report back...hi I may go the other option and use the WA1SOV circuit diagram, using an ad607. But will see how easy it is to get the devices.
Surface mount devices is not a problem....

Red, you can control most of the rig functions with the 59 mike (I know, because I have one), but I think it would be a real challenge to operate as you propose, simply because you can't see the frequency or other info on the rig's display. you can key in a frequency, for example, but you have no visual feedback to ensure that you entered the right numbers.

On the other hand, it's really not difficult to mount the FT-897 in a location where it's visible and accessible to the driver. the 59 mike expands your options.

I looked at the interior of the Avalanche on the Chevrolet.com web site, and it appears that you have more than ample space on the console between the two front seats, assuming you don't fold the seat into position and have three people sitting in front. There's a simple way to provide a secure platform, onto which you can either screw the MMB-80 mount or fabricate your own. I have made such a mount for my Toyota Prius, and the same basic principles could be used to fabricate a mount for your Avalanche.

Let me know offline if you're interested and I will send you a writeup of the project. email address is my_callsign (at) mac.com.

> I believe I understand correctly that there is no head separation accessory for the FT-897D like there is for the FT-8900R (I have both radios). In a mobile application, can the FT-897D be mounted remotely, such as under the back seat, and operated successfully with the optional Yaesu MH-59A8J microphone? Or, must it be mounted in the vehicle so that the operator has fingertip access to the front panel controls?
>
> I plan to keep the FT-8900R in the vehicle most of the time, but I would like to have the Yaesu MMB-80 mobile mounting bracket installed my Chevy Avalanche so I can take the FT-897D from the shack and drop it into the vehicle when I go on trips. I would also appreciate any insights from others who have experience installing these radios (and antennae) in the Avalanche. The space under the back seat (either side) seems to have plenty of room for the FT-8900R to be bolted to the floor. Can anyone tell me how much vertical clearance the FT-897D would require when bolted in the same location, adjacent to the FT-8900R's mounting bracket (assuming, of course, that the FT-897D can be operated remotely with the MH-59A8J microphone at all!)?

There is a surface mount fuse in line with the CAT output. When I blew mine by inadvertently shorting it out while checking it's output, I simply put a solder blob across it. Not Yaesu spec, but it works.

WA1SOV's design offers some interesting enhancements over the simpler downconverter I built. You might want to contact him to see if he made up a batch of PCB's for that project. I just spoke with him yesterday and he is still soldering and experimenting like a madman.

I'd love to hear how the 897D works out as a front end for your project. There's plenty of IF energy at the filter point but choose your coupling cap with care. I think I ended up with 130pf, but a smaller value (50pf?) would probably be better as I could detect a slight drop in the 897D receiver when I selected that filter slot. Alternatively, a single transistor buffer would create enough isolation to prevent any loading of the 897D IF chain. Computer type header connectors will slide right over the 897D filter pins even though their spacing is slightly different.

Digi-Key was carrying the parts when I looked into it last winter, however, I have heard that the NE602 was being discontinued. Probably lots of them still out there though.

Good luck!

One thing to check is whether the CAT plug is actually mating with the receptacle on the radio. This is a common problem with this radio. Since the receptacle is recessed, and there's not a whole lot of clearance, you may have to "shave" the boot of your plug. I had to do this on my rig.

CT-62 and CT-39 are mentioned on page 3 as optional cables.

The cable ct-62 is mentioned on pg 63 in more detail.

Both cables are handy to have if you have a computer nearby. My CT-62 has
the older serial connector and the CT-39 has a Universal Serial connector
(USB).

The CT-62 is used to transfer data to and from the radio/computer. The
CT-39 came with the radio programming software. It's a spreadsheet program
that reads and writes to your radio's memory.

The CT-62 is used by all computer programs that access the radio (Digipan
HRD etc).

Why a second cable is needed, I dunno.

But he is referring to the 897 - NOT the 857 - two different monsters.
It is *possible* to home-brew a separation kit, but I know of none
available commercially.

You'll get a better, clearer picture of what's going on from the manual.

However the sad truth is you'll need the more expensive cable for those
operations.

The CT39 cable has only one purpose I know of. It access the memory(data).

For what you are talking about, the CT-62. Although there maybe a USB
version. I've looked for the beast but no luck.

From: Axel Behrens
Topic: 28380 Message: 28393

Dear Bart,

I also use the FT 897D with a laptop and HRD for PSK31. You will need the mentioned cable (CT-39 or CT-62) for controlling the rig (called CAT). This will let HRD control the frequency and settings. Which is nice if you want to use the built-in log for example. Secondly, you will need to connect the soundcard of your PC with the TX. I use a selfmade cable, which connects the mic/ear from the soundcard to the DATA port of the TX. This way you can keep the mike connected and during PSK you can turn the volume of the speaker down. This is a very cheap version but please keep in mind, that you do not have a galvanic isolation of PC and TX, which might cause some problems. For me it works fine - but a SignaLink interface is on my wish list for x-mas. :-)

You can find the details for the pin connections in the file section/handbook or contact me, I have some info/pictures of my cable.

Hope to work you soon in PSK31

28394. 'On the AIR' light

Yahoo group: FT897 (2009)
Date: 2009-11-27 01:51:36 UTC
From: Finnigann
Topic: 28394 Message: 28394

Does anyone know of a way to switch on a light when I pick the microphone out of the mic holder?

I was thinking of a switch/mic hanger combo but a search with google doesn't turn up anything.

It should be fairly trivial to mod a mic hanger to have a microswitch mounted behind it? mounted on a block of wood with a recessed hole cut to mount the microswitch in.. - might take a bit of fiddling, but it should work ok :)

Cheers,

DG

Hi James,

I assume that you mean a light at the operating position or similar.

You could install a reed switch on the microphone hanger and a magnet inside the microphone so that when the mic is on the hanger it operates the reed switch. Then, when you take the mic off, the reed switch changes state and the light comes on.

It is possible to get reed switched which are normally closed and switch to open when the magnet is bought into proximity. The more common ones are normally open. There are also SPDT around too.

First- Happy Holidays!

Now, my question. I want to try data mode operation, such as PSK31. I also downloaded the Ham Radio Deluxe software. What cable will I need to use HRD and PSK31? Is it the same cable for both? Two different cables? Where would it plug into the back of the radio? The same place for both HRD and PSK31 or a different place for each function. I've used a Kenwood TS820 for years and this new high tech radio stumps me at times. But on another note it is a nice radio. It really does it all. In fact I told my wife if this radio could be programmed to cook dinner she'd be out the door.

Thx to all

Bart

And how much would you charge? j/k

Know of a source for micro switches?

Yeah, it's easy to design something in my head. I was hoping someone had
already done it and was selling something I could use.

Wow, that's a really good question - I actually haven't seen them in a cattledog in ages! I'd guess farnell would have to have them though?? I just grab em out of one of my parts bins (many many years of stripped down printers and the like, from wanting to build a robot when I was younger... yeah that didn't happen.. :))

grin yeah I know that feeling! I finally un-boxed my ham gear (except for my kenwood APRS handheld, everything had been boxed since a house move in 2003!) about 9 months ago.. I think I've actually sat down in the shack five nights in that time :(

Some older Motorola commercial radios had a mike holder with a built in switch.
A Motorola dealer may have one.
Later radios used the mike button as the switch. It was used to switch the radio to listen before you talk mode when picking up the mike.

I'm confused by the answers you've gotten so far. They are not at all consistent with what I'm doing and I use my FT-897 for both PSK31 and VHF packet. I have to admit that I don't do radio control via HRD or any other software (i.e., I manually tune my radio).

First of all, digital modes (PSK, RTTY, packet, etc.) all involve the same thing -- modulating a carrier with sounds that represent the digital bits. There are two basic methods used -- phase shift key (e.g., PSK) and Frequency Shift Keying (used in packet for example).

In order to do that, you need an interface between the radio and the computer that can MODulate/DEMomdulate (translate digital bits into sounds and translate sounds into digital bits). In case that phrase MODulate/DEModulate looks familiar, it's because what we're talking about is a MODEM. Unfortunately, we can't use the modems that are already on our computers because we also have to provide some radio control in the form of triggering the radio to transmit when we're sending (i.e., the ability to trigger the push-to-talk function). In addition, if you're doing packet (such as WinLink), your modem also has to provide a Packet Assember/Disassembler (PAD).

The FT-897 has a DATA jack in the back of the radio, next to the CAT jack. You will use the DATA jack for digital. That jack provides lines for input/output of either a 1200 baud or 9600 baud signal coming from the modem plus a line for the push-to-talk function). The CAT jack does not provide for the input/output and is not the jack you need for digital.

Broadly speaking, you have two basic choices for the interface between the radio and the computer:

1. A TNC such as the classic Kantronics or newer TNCs such as the TNC-X. The difference between them is cost (TNC-X is about 1/3 the cost of a low-end Kantronics) and what capabilities they provide in addition to the MODEM, PTT control, and PAD (the Kantronics provide host services such as bulletin boards as well as the ability to interface with multiple radios at the same time).

2. A sound card-based interface such as the RIGblaster or SignaLink. They differ from a TNC in that they use the computer's sound card for the MODEM functionality (a computer sound card is a form of modem since it translates sounds into digital bits and vice versa). The lower end RIGblasters and the SignaLink generally run about 1/2 or 1/3 the cost of a Kantronics. Generally speaking, you need a reasonably modern, reasonably fast Windows computer. Practically speaking, pretty much any Windows computer with a good sound card purchased after about 2001 should do the trick. I don't offhand know if RIGblasters, etc. work with Macintosh or Linux computers.

The choice of which type of interface is up to you. Either one works well with DM780, which is the piece of HRD that provides access to the digital modes. I personally have a RIGblaster Plug&Play, which costs about $100 from HRO or AES (or direct from West Mountain Radio, the manufacturer). The nice thing about the Plug&Play is that it comes with an output cable pre-configured for the FT-897's data jack -- you don't have to solder anything and you don't have to buy a Yaesu cable. After installing some software (from the CD that West Mountain Radio supplies), you simply plug the USB on the RIGblaster into the USB port on the computer, plug the two audio cables into the computer sound card's MIC in and SPKR out jacks, plug the other end into the data jack on the FT-897 and you're in business from a hardware/interface point of view.

You will have to configure DM780 to tell it what COM port you're using which you would have to do under any circumstance.

You will also have to configure your radio. Use menu setting 38 to specify whether you're doing PSK upper sideband, PSK lower sideband, RTTY upper sideband, RTTY lower sideband, or some other digital mode. Most people use PSK upper sideband, and certain variations of PSK require upper sideband. You then set your mode to digital and away you go. My very first QSO on PSK-31 was Connecticut to Tasmania on 5 watts. I just submitted for WAS on PSK-31 and I have over 60 countries. CT to Eastern Europe on 40 meters with 20 watts is an everyday ho-hum event, and I'm only running a dipole that's about 35' high.

I did a presentation to my club about packet and EMCOMM, but you may find it interesting for what it says about interfacing radios to computers for digital modes. The presentation is at

http://www.ctsara.org/VHF_Packet_Radio1.pdf

Hope to see you on the waterfall.

Jon,

Thanks for the clear and comcise info. Just getting started on HF digital and I was confused about how / if it was different than the VHF stuff. In particular I was wondering if my TNC-X would work with the HF modes.

Great presentation too. Can I use if for our local EMCOMM training?

From: JonP
Topic: 28380 Message: 28403

Thank you for the kind words.

The TNC-X is intended to work on both HF and VHF/UHF digital modes. I have not personally tested it, but I know of at least two hams who use the TNC-X successfully on HF as well as VHF/UHF.

In general, a TNC or sound card interface that works on HF will work on VHF/UHF and vice versa (at least I've never heard of any that work on one or not the other). There is nothing in the TNC or sound card interface that knows what frequency the radio will be tuned to.

There is an issue with PACTOR software because it's mostly written for Linux, but that's not a function of the interface hardware, only a function of the software. As I understand it, the PACTOR stuff is targeted at Linux because Windows has too much overhead to be effective with PACTOR.

You may use the presentation for your local EMCOMM training as long as you retain the copyright on each page and retain the front cover with the reference to the Stamford Amateur Radio Association.

you don't need to buy the cable, I used an old PS2 keyboard cable, (you can buy them, but cheaper just to find an old keyboard) and put two jacks on correct pins, you will need an ohm meter to find the correct pins, (wiring diagram for the radio end is in the manual) and plug into your mic and head phone jacks, set up digital VOX on the radio to key. you will need to adjust your audio levels on your laptop and your good to go. I use this quit often without any problems. As a option, you can get two audio isolation transformers (about $4 at radio shack) to isolate the audio from the PC.

I've never done it but can you set the repeater offset to something else
in the VFO or memory channels?

145.80 Receive
144.80 1 MHz down transmit

It should be set in menu # 76.

I don't know why everyone keeps thinking you need to buy a TNC or a sound card interface to get on the digital modes. yes they make it easier, but if your just starting out you don't "need" them to do it, just a simple cable most Ham radio users can make for just a few $$$. Most modern radio software has a sound board interface option that lets the computer do all the tnc function by just interfacing with audio interfaces on your radio. The data connector on the 857 and 897 are no more than an audio in and out. The connector is a PS2 type connector, (same as used on a ps2 type keyboard) In the cases where you need a TNC, you can download the AGW Packet Engine software which is a software type TNC. http://www.sv2agw.com/downloads/default.htm Nice thing with AGWPE is that your can set it up to "share" your TNC via TCP/IP and it allows you to use each audio channel (stereo) as a separate TNC so you can run APRS on one radio, while you run PSK31 on your HF rig. I have done every Digital mode at one time or another, I am on PSK31 frequently, have even setup APRS with my laptop hooked to my GPS, running mobile while on Vacation all off a simple cable I made. If any body wants more info, please fill free to send me an email.

DE N7UVL,
If funds are limited and a 13.8VDC 25/30 Amp supply is already on hand,
you could go that route for now. "Float" charger implies "trickle"?
-Although it adds weight and cost, the FP-30 internal supply works
great and still allows external 12V(13.8) for portable operation for
full output power. (internal battery supply does not allow that)/ga

From: Larry D. Barr, K5WLF
Topic: 8844 Message: 28420

I don't think he's referring to the internal battery packs, which do impose a 20 watt power limit. I think he means an external battery.

I have 2 X FT-897D and run them, along with the rest of my gear, off a pair of 100 Ah SLA batteries, charged by a 45A linear PS through a West Mountain Radio SuperPWRGate 40S. They run off the supply until the grid fails and them seamlessly revert to battery operation.

I've had several grid failures during severe WX and the system has worked flawlessly every time. I believe that this is the most reliable way to power a station. The 40S acts as a transfer switch, through a pair of Schottky diodes and a battery charger.

Let me clarify that last sentence which was rather poorly written --

Using a pair of Schottky diodes, the 40S acts as a transfer switch, and
also contains a 3-stage (bulk, absorption and float) charging circuit to
maintain the battery bank.

There, that's better...

What amplifier do you have, and more important, what signals does
the amplifier need from the FT897?

If it's just TX GND (a pin that goes to ground when the TX keys),
and perhaps ALC, then you may be in luck.
Starting with lot 25, there is an undocumented jumper on the main (top)
board that can change the TX REQ pin of the ACC plug, from TX REQ
(for tuning), to TX GND, the same signal as on the DIN plug.
J1027 can be found immediately next to the short end of the
REF-UNIX/TCXO module. Change the jumper, and the plug will read:
tip: ALC in
middle ring: TX GND
base: GND

Unless you use the BAND signals from the DIN plug (in which case things
get difficult, as BAND A and BAND B share pins with RXD and TXD respectively)
you should be able to make this work.

If you do this, please put a sticker on the box so that we don't get
"TX REQ no longer works" questions on this list in a few weeks..

> new. The radio is several years old.

The question is if you are willing to do some analysis yourself,
and exactly what happens when you press the power-on button.
(of you have the DTMF mic, does the same problem happen if you
use the mic power-on button?)

The way it works is that the power-on switch grounds POSW, which is
connected to the cathodes of D1033. One half of this diode grounds
the gate of Q1031, causing it to conduct. This powers-up a whole
lot: Q1028, a 5-volt voltage stabilizer that powers the main CPU
on the main board. It also switches Q1030, which is just a voltage
comparator to give the CPU a power-on reset pulse.

The processor, once reset, will start up and if all is well,
will drive PWR-ON to Q1035. This, in turn, will ground the gate of
Q1031 so that the circuitry remains powered-up even if you release the
power button.

Note that the main CPU talks to the front CPU via cable J1018
(this is a built-in cable on the FT897, it is replaced by a RJ14
"phone" cable for the FT857 with it's detachable front).
If this communication doesn't work, then the main CPU will power-down
the rig in roughly a second after power-up.
I am not sure if that is that you describe above. When you press the
power button, does "nothing happen", or does the rig kind-of power-up,
and then power doen again?
In that case, the front-panel CPU doesn't start up, or perhaps has
a loose connector or similar.

Repair / access to these components is not trivial, but do-able.
Keep in mind that most of the power-on circuitry is on the bottom
of the main board, close to the big 7808 voltage regulator.
But, to diagnose this, you don't need RF, so you can disconnect (and leave
disconnected) both the green (RX) coax cable and the red (TX) coax cable.
To make sure nothing happens if you accidentally transmit when the red
cable is loose, flip switch S1001 on the main board, unpowering the
pre-driver stages of the PA. I also always tape-off these springy
coax cables, just in case they cause a short.

You only need two cables: the flexfoil (connecting the main board
to the PA board on the bottom, powering the main board), and the white-green
cable going to the front panel and both are long enough to allow the board

to be connected while being upside-down. Be sure to tape off the diecast chassis to avoid short circuit accidents should the bord tip over.
I "did one" just the other week and it was just a few hours.

Hope this gets you started,

Geert Jan PE1HZG

28424. Re: [FT897] I need a 2nd CAT/LINEAR jack

Yahoo group: FT897 (2009)
Date: 2009-11-29 15:15:20 UTC
From: Lew Phelps K6LMP
Topic: 28414 Message: 28424

As others have described, you can access a second CAT/Linear port at the mike jack and and changing the settings with MENU 59 to CAT. This changes pins 1 and 2 on the mike jack to Data Transmit and Data Receive. All other pin functions remain unchanged.

The problem you face is that this takes away your mike jack. Nenad Rotter of Croatia (9N5AN) described a project in the April 2007 issue of QST which plugs into the FT-897 mike jack and provides a 9-pin serial connector for the CAT port, an RJ-45 jack for the original hand held mike, a 3.5mm coaxial mike jack with optional electret mike voltage supply, and a jack for a PTT foot switch. Neat project. The template for the required circuit board is available on the ARRL web site.

Some months ago I modified the project so that the data output is a USB port rather than a 9 pin serial port, since my laptop has USB but not a 9 pin serial connector, and I wanted to eliminate the need for a USB-serial dongle. I have written up that project and posted the circuit diagram and discussion of the project construction into the FILES section of this group, under the heading "USB + Mike Port." (The diagram and write up are recently posted, replacing an earlier version that contained a small but significant error in the schematic -- grounding the Mike to GND rather than MIC GND. The new version of the circuit diagram fixes that problem. The old version has been removed from the Files section.) These are posted with my Yahoo user name pasadenalew.

This project fits into an LMB project box measuring 4.25 x 2.25 x 1.375 inches, and requires no circuit board etching. It provides six functions:
1. USB port
2. Small LEDs to indicate inbound and outbound data flow through the USB port
3. 1/4" and 1/8" (3.5mm) coaxial mike jacks
4. Optional voltage for electret mikes on the coaxial mike jacks.
5. Jack for PTT foot switch.
6. RJ45 jack to allow use of the original Yaesu handheld mike or other mike with RJ-45 connector.

This project requires roughly $45 in components and the ability to solder. It will allow you to use BOTH the amplifier and the logging software, or the logging software and automatic antenna tuner. The mike jack must be used as a CAT port, but the original port on the rear of the rig can be set for either TUN or AMP.

You might be interested to know that I am in the final stages of prototyping a new version of the project that has all the functionality of the original, but shrinks it into an incredibly small project box measuring only 2.25 x 1.5 x 1.5 inches, about 1/3 the volume of the original project. I have laid out the circuit board (same circuit exactly as the existing project). It measures 2.15 x 1.35 inches. All the components fit into the mini-project box, but just barely. I will write up the "honey I shrunk the project" version and publish it to the group when I have etched the circuit board and verified that it's functional. I hope to have this done in a week or two.

I use both, but if I had to choose I'd go with batteries since I live in a place where we often lose electrical power for several hours. Also, if there's a major disaster it would be good to have a solar panel to keep your batteries charged if grid power was lost for several days or weeks.

Hi Ali,

I power my FT-897D from a 100AH SLA battery with a 2A current limited constant voltage (13.8v) charger, of the type used in security panels. A 2A charger is sufficient for 24/7 float charge, even with heavy TX periods! I don't know if you really need 100AH capacity, but mine was a gift!

This arrangement is very useful during storms and in the bushfire season when the 240V AC tends to be unreliable. I've used this setup for over two years now, without any problems.

Regards,

David, VK3BDK

BTW I love my FT897D. It sits nicely between my computer and monitor.

From: Jirka MWW
Topic: 28431 Message: 28431

Hi Hams,
Inrad offers for FT897 under the number: #917 VHF Filters for Experimenters : roofing filter for 68.33 MHZ, it means for 1st. IF.
Dollar is now very weak, therefore it is a good chance to buy it. Before I will do it I would like to ask expert in this forum following questions :
1. Is here somebody, who is really using it ?
2. What kind of effects can I expect on RX, especially in big VHF contests (many big gun stations in narrow segment (EU hams know what I am writing about) ?
3. are there any positive effects at TX (maybe less transmitted noise in wide range) ?
4. Are there any clear instruction for the installation on Internet ? How difficult is it ?

Many thanks in advance for any input.

Hi Tom,
I sell these 6 pin connectors on my web site for $5.95CAD,
I also make custom power cables as well. If you or anyone else is interested
please contact me at rick@....
Web site: www.armitronpower.com

I'm guessing that you have an amplifier that does automatic band switching and that's why you're using the DIN plug. If your amplifier does not accept CAT commands and your just need a dry contact, use the ACC plug on the back of the radio to key the amp. I had to remove the top cover and change a jumper position to enable the ACC to key the amp and accept ALC. If this would be useful to you, let me know and I'll try to find some documentation.

From: nnvpears
Topic: 28436 Message: 28436

I saw that the Yaesu website lists the YSK-857 as an option with the 897, does this work for the 897/has any one done this. Secondly does the factory mounting bracket MMB-80 allow for easy removal of a rig from a mobile installation to be used as a base radio?

Thanks
Nathaniel

DE N7UVL,
Commenting on the MMB-80 use:
With the MMB-80 side brackets installed, either of the two
side mounted Tuners (LDG or Yaesu) will require spacers on
the tuner lower mounting screws in order to maintain the
mounting distance at both top and bottom. Otherwise the
many other available "free" standing tuners don't have this
aspect to deal with./ga

Wow, thanks for all the feed back. All of these suggestions are spot on. From the simple fix to the more complex mods and projects. This is the kind of info I was seeking. tons of knowledge in this 897 group collective. Thanks to all.

Some have asked what amp I'm running. I have an old Ameritron 811. One day I might upgrade to a smarter amp, but the 811 just won't quit.

Geert detailed a mod to the main board that might just work w/ this amp. And Steve suggested a similar, if not identical, mod. Thanks guys.

I'm also using a computer w/ only a usb, so I've got the serial/usb dongle thing going.

btw, great little project and excellent article Lew, k6lmp, can't wait to read about the smaller version your working on.

Dale mentioned a quick and dirty pig-tail mod to an old Mac keyboard cord. That project is posted in the 857 group. I might have some of those cords laying around the shack here. Thanks for the heads up Dale.

And Stan brought our attention to the Cat-Mate that W4RT is offering. W4RT has some great stuff.

Thanks for all the help,
Kev, KJ4GLK

28439. LDG-897 Auto Tuner

Yahoo group: FT897 (2009)
Date: 2009-11-29 22:53:40 UTC
From: daoijo
Topic: 28439 Message: 28439

I have the LDG auto tuner for about 1 month now and love it, but...

From time to time I find myself transmitting and the HSWR indicator goes on and the SWR meter goes high. This is after I tuned it for the frequency I am transmitting on. I immediate stop transmitting when this happens and press the tune button and the SWR immediately improves. Has anyone else found this occurring with the LDG?

I'm not 100% sure this is what you need but it looks interesting: Look at ebay item 370292656058. I found it by doing a search for "8 pin mini din". If this isn't what you need, perhaps your search on ebay will help you find something better. Good luck, Kent ad7hk

Re. the MMB80. To detach the 897 from it you loosen a screw at each side at the front, and remove two screws to the back at the side - takes about one minute. It then slides out. Of course, you have to then remove the power plug, two aerial connectors and the earth strap. I wouldn't want to do it every day.

When I bought mine I did look around for a quick release mount, but there doesn't seem to be one.... Be interested to know if anyone has found one!

For those interested my 897 is shoe-horned into a Vauxhall (Opel in some countries) Astra above my right knee. It's very handy there and out of sight of passers-by.

Google tells me that in england and malta, you drive on the left side of the road like us here in .AU, so I *really* want to see a photo of this!! Unless your Astra is *really* different to our Astra (Holden, here in .au), I just can't figure out where on earth you've got it.. last time we took the mrs car camping, we had trouble with 1st/3rd/5th gear with just the 4-way adapter plugged into the cigarette lighter (yes, that's on the left..), and I just can't think of ANY space on the right hand side.. - I can't imagine fitting an 897 anywhere in the front of the thing, unless it's on top of that awesomely deep dash!

So yeah, if you happen to take a photo or two and post them up, I'd *love* to see them, my mind boggles at the thought of any kind of non-remote-head rig mounted in the front of an astra! :)

Cheers,

Damien

28443. Signal Breaking up

Yahoo group: FT897 (2009)
Date: 2009-12-01 15:56:03 UTC
From: Danny Loyd
Topic: 28443 Message: 28443

I have possible simple question, but can't seem to figure it out. When I transmit on 80 meters, I get a report that my signal is chopping off. I have tried sitting the mic gain, processor level, and retuning as occasionally I get VSWR indications if I don't tune on the frequency I am operating on. I know this sounds simple, but I am still learning and relearning HF operations.

Thanks,

Danny Loyd

I am using the FC-30 Yaseu power supply. The other night on 40 meters there was no report of breaking up, but the last two nights on 80 meters I got reports of signal breaking up. Changed mics and had same results. Moved down to another freq for one on one QSO and turned off the processor and ran the mic gain down and was told that signal was good. Went back up to 3942 and was told signal now strong but will chopping every once in a while.

Would be worth doing a test with someone with your original settings
and watching the ALC indication and see what that's doing. Then go
into the menu and reduce SSB mic gain by half and do the test again.
If still problems keep reducing mic gain again by half which should
resolve it.

Sounds to me like you're overdriving, and a different freq/aerial just
tips it over the top, or doesn't. Best of luck!

From: iz0inx
Topic: 28439 Message: 28447

Yes, it frequently happens to me as well.
In addition to what you described I also experienced the following:

When I'm at home, I prefer to use my MFJ-993b as tuner, so I have the two tuners attached in series.
I obviously perform the bypass procedure on the AT897, by pressing the tune button for a short time. This allow me to tune with the MFJ.
Often, when I'm transmitting the HSWR indicator goes on and the SWR meter goes high.
As soon as I shortly press again the tune button, everything goes normal.

I don't know the reason why this happens, it looks like that some relay is activated under the RF effect. Very annoying.

Hello

I do not have the AT897 tuner but I do have the AT100 Pro which I use with my 897. It has a facility for automatic and semi- auto tuning. In the semi-auto mode you must hit the tune button to tune whereas in auto mode tuning commences as soon as you hit the key or press the ptt. Could it be the same with your AT897? Worth checking out

Hi Jim,

I know what you are talking about, my MFJ-993b has the same facility, but this is not true for the AT-897, there is no way for activating the tuning by pressing the ptt, it only starts tuning by pressing the Tune button.

On the other hand I know that Ldg is now puttinhg on the market a new version of the AT-897, called "plus" or something like this.
The new model differs from the previous one because it actually uses the CAT communication, whereas the previous one just takes the power supply from the FT897 CAT socket.

28450. Re: Signal Breaking up

Yahoo group: FT897 (2009)
Date: 2009-12-01 22:04:44 UTC
From: Steve Yates
Topic: 28443 Message: 28450

It may also be a case of RF feedback which is very common. RF from the antenna gets coupled back into the radio either directly from a close antenna or via common mode currents on the feedline and can cause severe problems on SSB. Instead of turning the mic gain down, turn the power down and see if there is any improvement. The mic gain alone will no limit your power on peaks so there may still be some feedback. If turning the power down corrects the problem then you can work on measures to eliminate RF at the rig.

Thanx for replying Steve,

Sorry for the late reply, but Ive been on my Honeymoon.

Ive tried changing the AGC from Auto to Fast to Slow, but to no avail.

Same old story, the S meter just sits there.

Im really not sure whats causing it. Unless its something to do with HRD which I am running simultaneously.

Hi Jason,

If you do not have the RF gain control at maximum, this will be normal behaviour. As you reduce the RF gain control, the S meter will gradually indicate more and more as the gain control normally works by putting a DC voltage on the AGC line to reduce the gain of the controlled amplifiers. As the S meter is basically reading the voltage on the AGC line, if you have a fixed voltage on it, then the meter will read that and only move above it if the incoming signal is strong enough to need more AGC.

Hi Damien. Not sure if the Holden-make Astra is the same as the Vauxhall one but you'll be able to tell from the pics I've put in the photos section - look for *897 INSTALLED IN VAUXHALL ASTRA*. Unfortunately it hasn't put them in numerical order, and there wasn't much room for descriptive comment! So here are a few ad hoc comments....

The mic is the Yaesu MH-59A8J. The gold earth strap (UR67 braid flattened) can be seen to the right. This goes to the door pillar and is only about seven inches long. The power cable is wired direct to the car battery - the garage put this through the bulkhead for me when the car was in for servicing. There is plenty of room for my right leg between the seat and 897 - I did try mounting the rig lower but it fouled my foot on the brake :) When driving the view of the screen is great and all controls to hand. I removed the fuse box cover completely so that the rig didn't have to be removed to get to the fuses.

Any more questions, just ask!

.d. G4TUP.

28454. Re: [FT897] Plans for a better mobile set up

Yahoo group: FT897 (2009)
Date: 2009-12-02 21:28:06 UTC
From: Damien Gardner Jnr
Topic: 28436 Message: 28454

Yep, thats exactly the same as the missus' car - I seriously wouldn't have thought there was enough leg room in there to put a transceiver, but it would seem I'm wrong! Hrrrm, I wonder if she'd let me screw stuff into her under-dash.... :)

I'll definitely have to look into the mobile mount - it certainly beats the large number of cable ties I currently use to hold it to the cargo barriers in both cars!! (I mainly only use it for HF APRS when we're on holiday, with the occasional sitting-in-the-boot DX'ing session :)

Cheers,

Damien

PS, speaking of the Astra, we found a *REALLY* big security hole on our last holiday... - were running a waeco fridge, so had one of those little 500A jump starter things sitting in the boot with it, to power it when the car was off - and had planned on just having a dual ended cig lighter cable to go between the cig lighter socket on the jump starter, and the car's cig lighter socket.. Except it would appear that the cig lighter socket on the astra is permanently wired to the ignition circuit.. That is, if you supply 12V there, and give the car a push-start, it runs, albeit in limp mode, because the key hasn't 'unlocked' the ECU, but you can still do up to about 60k/h in limp mode fairly well Since then, we always turn the wheels to hard lock before putting the steering lock on - don't want someone driving it away down a street and up onto a tandem!!

From: Risk
Topic: 28374 Message: 28455

Hi Eric,

thanx heaps for your reply. You just solved the last part of the puzzle for me.

Last night whilst I was playing around with a few settings, I almost cottoned on to what you just aluded to. Almost. Basically, I thought about a couple of things and decided to go mess with the Squelch/RF Gain. I all but turned the squelch off, and returned the setting to RF Gain. And things started moving again. But, wasnt perfect. What Ive been doing is playing with the RF gain, AF Volume, and the volume coming through the computers speakers and headphones i Have here.

So Ive been doing this massive juggling act, trying to get the sound coming through to sound good. (Im still waiting for my Tigertronics Signalink USB to get here from the UK, and it turns out Royal Mail International needs to take a leaf out of USPS because they are slower than a wet week.)

Anyways, in doing this juggling act, I didnt even take into consideration the circuit in use. As you said, the voltage is being sampled and whilst it is constant, nothing will change. So I thank you immensely Eric.

73's to you and to Steve as well.

Cheers

Jason

Cheers, thanks for the tip! Now I know how to hot wire all the Astras around here ;)

All the best with the 897 in your own Astra...

28457. using AC LOG

Yahoo group: FT897 (2009)
Date: 2009-12-04 03:50:00 UTC
From: al_lewek
Topic: 28457 Message: 28457

I am having no success in interfacing AC LOG with my FT 897D. Has anyone been able to get these 2 to work together? The radio works fine with HRD. Any hints on settings? Thank you all in advance.

28458. Which Tuner?

Yahoo group: FT897 (2009)
Date: 2009-12-03 17:00:06 UTC
From: treebs.family
Topic: 28458 Message: 28458

I'm getting back in to ham radio after a break and am looking for advice on a tuner to go with my FT-897D. I've seen a number of articles but none really match my situation and I wondered if anyone here had any advice....

We've a Hy-gain explorer 14 tribander beam and a trapped dipole for 40 and 80m. I've looked at the Yaesu ATUs and other separate units to go with the FT-897D but there seem to be pros and cons in all directions. I don't plan to be portable or mobile but I am a little space constrained - I work from home and the shack is one end of my work desk! Needless to say it is not on during the work day but it's a fast commute at the end of the day!

I don't have an amp at the moment, it just the FT-897D, but we may consider one in the future if things go well.

Thoughts, comments, suggestions all welcome!

Thanks,

Jenny G7BBP

Hi group,
I am looking for an alternate battery for the FT-897 and I need the connector that goes from the FNB-78 to the FT-897. So if anyone has the connector or a whole DEAD FNB-78, I want to hear from you.

Thanks,
Don

From: Jim Henry
Topic: 28458 Message: 28460

I use the LDG AT-100PRO with my 897 and it works very well. It comes complete with an interface for the rig which makes operation very easy but it can also be used with any other rig. Maximum power is 125 watts but the AT200 and AT1000 handle higher power levels. I have used my tuner on long wires, dipoles and beams.

I'm using the LDG AT-897 and love it. It bolts onto the side of the rig, takes up little space and works beautifully.

28462. Re: Which Tuner?

Yahoo group: FT897 (2009)
Date: 2009-12-05 12:36:13 UTC
From: JonP
Topic: 28458 Message: 28462

I've done some testing of and research into different tuner options and come up with some rules of thumb. In the following, when I say "reliably" handle I mean that I could not create a condition that it could not handle within the SWR range given, and I could not find any research in which others were noting problems when used with a properly working antenna, rig, and tuner.

1. Rig internal automatic tuners tend to be reliable up to about a 3:1 mismatch.

2. Rig-specific external automatic tuners tend to be reliable up to about a 4:1 mismatch -- maybe 5:1.

3. Full-sized external automatics like the MFJ-991B tend to be reliable up to about 12:1.

4. Full-sized external manual tuners like the MFJ-991E tend to be reliable up to about a 20:1 mismatch.

This doesn't mean that one of these tuners won't do better than that -- it's just that I could readily create conditions that they couldn't handle or could find plenty of references of people trying to use one and having it not work for them. Whether or not they will do the job at a higher SWR seems to be a function of the specific capacitive impedance and inductive impedance values causing the higher SWR (i.e., magnitude and phase), and not simply the fact of the higher SWR.

Your first reaction may be "but I'm going to put up a good antenna, why would I ever need to match a 10:1 or 15:1 or some crazy values of capacitive and inductive impedance?? The answer is twofold:

1. Many multi-band antennas give you values of 10:1 or 15:1 or some crazy values of capacitve and inductive impedance on some bands. That's just a fact of life with multi-band antennas. For example, I have an 897D with the LDG AT-897 attached and a Radioworks Carolina Windom 80 Special. As with all multi-band antennas, the SWR and capacitive/inductive values are very different on different bands. On 80-15, the AT-897 does a fine job of tuning and I get out very nicely (WAS and DXCC). On 10 meters, the AT-897 just doesn't do the job and my signal output is weaker after tuning than before tuning. The internal tuner in a friend's Icom-746 was unable to tune up my antenna on 80/75, but was able to tune on 10 meters.

When I use an MFJ-991E with my 897, I can comfortable tune all of the bands. Recently, I used the MFJ-991E and the FT-897 to tune up a 2 meter 1/4 wave vertical on 75 meters, and got very nice 59+s from Stamford CT to Hartford CT, to Albany NY, and to White Plains NY at about 60 watts.

Don't take the above data about my Radioworks Carolina Windom 80 Special as a knock on that particular antenna. I've had similar (or more extreme) results testing on a Cobra Ultralight Sr, a Cobra Ultralight Jr., a G5RV, a homebrew Carolina Windom, a homebrew end-fed Zepp, a couple of different brands of multi-band verticals, and a couple of the Alpha-Delta multi-band slopers. Any multi-band antenna is going to give you "interesting"

combinations of capacitive and inductive reactance. You'll also see that many of them specifically recommend use with "... a good, wide-ranging external tuner ..." (to use the words from one of the Alpha-Delta antennas). Words like that in the ad for an antenna are a sure sign that you can count on being disappointed using a rig-specific tuner like the AT-897.

2. If you're running a portable rig like the FT-897, chances are you're going to take it into the field some day. And when you do you may find yourself with all sorts of interesting antennas strung up in trees or jury-rigged on poles or whatever. Unless you're operating something like a Buddipole or MP-1 where you can tune the antenna itself in the field, field work is very likely going to require you being able to match to something weird. That was why I was experimenting on the 2 meter 1/4 wave vertical -- to simulate an emergency situation where that was all I had and I had to get a signal out from Stamford CT to EOCs Hartford, Albany, and White Plains.

And please everyone -- notice I used phrases like "likely" and "reliably" and "sometimes" ... I know that you have your particular story of how you used your AT-897 on a lawn chair or a gutter spout or whatever.

28463. Automatic Antenna Tuner for the FT-897D

Yahoo group: FT897 (2009)
Date: 2009-12-05 13:07:49 UTC
From: Frank Krasnicki
Topic: 28463 Message: 28463

Jenny: I'm using the Z-11 Pro from LDG. It's a small tuner. Dimensions are 5" wide X 1 1/2" high X 8" deep. The tuner is either battery powered or takes power externally. I use the same power supply as the rig. The best part is that the tuner only consumes power when it's actually tuning. Once the tune is set up, latching relays hold the setting and power drops to virtually zero.
I've had mine for over two years and love.
Good luck with anything you choose.

Frank,

Thanks for sharing. Which power supply do you use with it, and why?

A very thoughtful posting, Jon.

Jenny, I'd add one item to Jon's list: Build your own manual tuner.

I have built several, one capable of legal limit load (even though I don't yet own an amplifier) and the other a small portable that fits into an extruded aluminum case measuring 4x5x6.
Both of these are simple L tuners that are built so the configuration is switchable. That is, (with the big tuner) with the turn of a rotary switch, I can set it for Low Pass Input, Low Pass Output, High Pass Input and High Pass Output configuration, as well as Bypass. The portable unit is a low pass L filter (Series inductor, shunt capacitor), and I switch the shunt between input and output simply by reversing the jacks to which the antenna and rig are connected. The Big Boy will match my 40 meter horizontal loop to every HF band (including 6 meters) on which the FT897 can transmit, even though it presents SWR mismatches of 20:1 and higher on some portions of some bands. Feeding it with 450 ohm window line (through a 4:1 balun) reduces line losses when transmitting on high mismatch frequencies.

There are lots of good antenna tuner designs floating around on the internet, in ARRL publications, etc. Also lots of argument about which basic tuner design (L, Pi, T, etc) is best. For my book, the L antenna is preferable simply because only requires one capacitor and one adjustable coil. Both components are readily available from surplussales.com and on eBay.

If you want the circuit diagram for my switchable L tuner, email me offline.

>
> 2. Rig-specific external automatic tuners tend to be reliable up to about a 4:1 mismatch -- maybe 5:1.
>
> 3. Full-sized external automatics like the MFJ-991B tend to be reliable up to about 12:1.
>
> 4. Full-sized external manual tuners like the MFJ-991E tend to be reliable up to about a 20:1 mismatch.
>
> This doesn't mean that one of these tuners won't do better than that -- it's just that I

could readily create conditions that they couldn't handle or could find plenty of references of people trying to use one and having it not work for them. Whether or not they will do the job at a higher SWR seems to be a function of the specific capacitive impedance and inductive impedance values causing the higher SWR (i.e., magnitude and phase), and not simply the fact of the higher SWR.
>
> Your first reaction may be "but I'm going to put up a good antenna, why would I ever need to match a 10:1 or 15:1 or some crazy values of capacitive and inductive impedance?? The answer is twofold:
>
> 1. Many multi-band antennas give you values of 10:1 or 15:1 or some crazy values of capacitve and inductive impedance on some bands. That's just a fact of life with multi-band antennas. For example, I have an 897D with the LDG AT-897 attached and a Radioworks Carolina Windom 80 Special. As with all multi-band antennas, the SWR and capacitive/inductive values are very different on different bands. On 80-15, the AT-897 does a fine job of tuning and I get out very nicely (WAS and DXCC). On 10 meters, the AT-897 just doesn't do the job and my signal output is weaker after tuning than before tuning. The internal tuner in a friend's Icom-746 was unable to tune up my antenna on 80/75, but was able to tune on 10 meters.
>
> When I use an MFJ-991E with my 897, I can comfortable tune all of the bands. Recently, I used the MFJ-991E and the FT-897 to tune up a 2 meter 1/4 wave vertical on 75 meters, and got very nice 59+s from Stamford CT to Hartford CT, to Albany NY, and to White Plains NY at about 60 watts.
>
> Don't take the above data about my Radioworks Carolina Windom 80 Special as a knock on that particular antenna. I've had similar (or more extreme) results testing on a Cobra Ultralight Sr, a Cobra Ultralight Jr., a G5RV, a homebrew Carolina Windom, a homebrew end-fed Zepp, a couple of different brands of multi-band verticals, and a couple of the Alpha-Delta multi-band slopers. Any multi-band antenna is going to give you "interesting" combinations of capacitive and inductive reactance. You'll also see that many of them specifically recommend use with "... a good, wide-ranging external tuner ..." (to use the words from one of the Alpha-Delta antennas). Words like that in the ad for an antenna are a sure sign that you can count on being disappointed using a rig-specific tuner like the AT-897.
>
> 2. If you're running a portable rig like the FT-897, chances are you're going to take it into the field some day. And when you do you may find yourself with all sorts of interesting antennas strung up in trees or jury-rigged on poles or whatever. Unless you're operating something like a Buddipole or MP-1 where you can tune the antenna itself in the field, field work is very likely going to require you being able to match to something weird. That was why I was experimenting on the 2 meter 1/4 wave vertical -- to simulate an emergency situation where that was all I had and I had to get a signal out from Stamford CT to EOCs Hartford, Albany, and White Plains.
>
> And please everyone -- notice I used phrases like "likely" and "reliably" and "sometimes" ... I know that you have your particular story of how you used your AT-897 on a lawn chair or a gutter spout or whatever.

From: Charles
Topic: 28458 Message: 28466

If you're only going to use it with the bare rig, the LDG AT-897 is a good choice, LDG have released the "Plus" version of the AT-897 which is a little more intelligent and may prove an even better choice. I have the basic AT-897 and use it with my FT-897 when operating portable but I do have an old Heathkit SA-2040 which I mostly use as I also have an FT-901 that I frequently use as well.
Good luck and welcome back,

I use the LDG AT200 Pro with my 897D and it works great. I have two antennas tie to it and it tunes then very well. Just hit the tune button on the tuner and away you go. It can handle two antennas and remember the setting for a quick tune.

Guys, check out Universal Radio's page on mike plugs and jacks at :

http://www.universal-radio.com/catalog/parts/micconn.html

Item 1834, the 6 pin Mic Jack, sure looks like the same thing as Yaesu uses on the battery, and the associated 6 pin mike plug looks just like the plug on the charger. You'd have to take measurements to be sure, or just order one for $3.99 and see if it will fit.

This is presumably the battery charger. Does anyone know the pin-out for it?
I already own a NiMH charger for that battery voltage and capacity - but it
has only 2 pins.

Thanks
- Richard

Topic: 28458 Message: 28472

I have the new LDG YT-100 tuner which is a dedicated tuner for the FT-897. This is a true "one touch" tuner. Just press the button, the tuner changes the mode to AM, reduces power, tunes, and then returns to your previous operating settings. No more fussing around changing modes and power levels to tune up. It looks like the new AT-897 Plus tuner is the same version of this tuner that bolts on the side of the rig instead of being a separate box like the YT-100. Regardless of which type of packaging you want, either the YT-100 or AT-897 Plus is the way to go as far as I'm concerned. Just be aware that these are not "true" autotuners. A true autotuner will retune automatically without any interaction from you if you change bands or antenna because the tuner will sense a change in SWR. The LDG tuners have to be told to retune by pushing the button. Knowing that I still think these are great tuners for the FT-897.

Jenny and All,

There are several factors which dictate what tuner is best. I have the 897D and the matching tuner--it does a good job, but not a great job! Often I use my 897 in the field with various types of antennas, many of which really need a more versatile tuner. At home, with just my R7 vertical, the matching tuner does pretty well. It's very convenient, but only for limited circumstances.

You really need to evaluate what you situation will be, and that includes serious thought about what antennas you will be using. Also, as you suggest, if you do decide to add an amp, then the matching ATU becomes pretty useless.

For me, it is important to have a tuner available that will deal effectively with both coax fed and balanced line fed antennas. By the way, you may find that balanced line fed antennas are a relatively cheap and easy way to get multiband capability. However, the matching ATU doesn't deal very well with this type of antenna. You can hang a balun off the back of it and hope, but your results may not be all you wanted. The range of impedences that unit is designed to handle are somewhat limited compared to many of the outboard tuners.

So, if you intend to use a reasonably resonant antenna, and you main concern is due to excursions on certain bands where you get a little too far from a resonance point giving you an SWR problem (40, 80, and 160 are typically where this happens), the matching ATU may do just fine. For just about anything more complex than that, you probably should think about a more capable/versatile outboard tuner.

Hi Al,

I use AC Log all the time with my FT-897D. I've uploaded the file "AC Log Settings.gif" to the group's files section to show how mine is setup. Just be sure that the baud rate that your rig is set to matches that in the AC Log's setup (MENU No. 019).

73,
Steve - AA5TB

I had this problem with no audio coming through until you opened the squelch. Also the rig had gone very deaf on the VHF port. So I returned the rig and got a replacement. This was after three months. The Sales of Goods Act in the UK allows this, or a refund. Don't let ham shops in the UK be a law unto themselves regard replacement or refund....

Topic: 28439 Message: 28489

Possible you have a fault with your antenna, not the ATU.
Have you tried TX into a dummy load. If all OK with that, then it is a fault with your antenna.

From: n5drgdanny
Topic: 28490 Message: 28490

Does anyone on this group know where i can have my ATAS 100 antenna repaired, Yeasu say's that they do not support this mobil screwdriver type antenna anymore for repairs.

My problems is that the anttena is loose insde the housing, and at its full lenth at 40 meters or any lenth it moves around enough that the audio and transmit chops or cuts out, meaning I am not going to use it any longer on my 857D, until it's repaired.

It cost to much to just discard in the trash.

Thanks for any help,
Danny

From: iwfhvfd
Topic: 28492 Message: 28492

I've had my FT897 for a couple of years and had no problems at all. About a month ago I noticed I wasn't getting out on HF like I had been. About the only HF I do is MARS. My lose of output wasn't instant, it was a gradual tapering off to nothing over a couple of weeks. With a power/SWR meter, 2m. works perfect, but the needle doesn't even wiggle on any HF band. It makes no difference whether I'm om my trapped vertical, my home made dipole, or store bought folded dipole. No meter movement on the radio either. I've checked and triple checked everything I can think of. Any ideas or does my radio need a doctor?
Thanks for any and all ideas.

Hi Danny,

there is quite a bit of information on the groups to help you do it yourself. They really aren't that difficult to dismantle and reassemble and you probably just have the broken solder joint at the base which is quite common.

73....Eric VK2VE.

I use a normal 25A amateur supply which doesn't have the nice advantage of fitting into the radio, but may be a cheaper alternative and does have the advantage of allowing other equipment to be easily connected to it. Mine is a switching supply, smaller and cheaper. I've not noticed problems with interference from it.

When I work portable I take some old Lumicycle cycle light battery packs I have. These are 13.2V, 4Ah. It's not as convenient as the built in battery, but again a cheaper option for me as I already had them. Some people use gel-cells which are heavier and bulkier, but again relatively cheap and available in quite large capacities.

Back in 2006 I used my FT-897D initially with an Astron SS-25A but found that carrying the two units was a pain. After much searching and price checking, I snagged a good deal on a brand new FP-30B from GigaParts during a one week Yaesu coupon sale. Now I carry the complete rig in a Pelican case and only have to drag along an antenna tuner.

28500. Re: [FT897] Which Tuner?

Yahoo group: FT897 (2009)
Date: 2009-12-08 20:52:35 UTC
From: af6cm_yahoo@myfastmail.com
Topic: 28458 Message: 28500

I have an LDG tuner, the AT-897. I like it, and it is probably the best choice for a *portable* station.

Reading your question, you are not constrained to be portable.

In your case, I strongly recommend a remote tuner. The reason for this is that tuners tune the feedline + antenna + balun (if there is one) *system*. You want to tune the antenna only if possible. Or reduce the length of the transmission line that the tuner tunes.

Having read this list for a while, I know that most users love their LDG tuners and recommend them. I agree with them for cases where the radio is used as a portable unit. This is not a criticism of the LDG tuners! They have an excellent tuning range, which is what I like most about them.

Another advantage for you is that the remote tuner will not take up space on your desk. It will probably be mounted under the eaves of your house.

Some examples are the Yaesu FC-40 (not to be confused with the Yaesu FC-30 which has a very limited tuning range) and the SDG tuners. Have a look at the reviews for these one eham.net.

I'm getting back in to ham radio after a break and am looking for advice on a tuner to go with my FT-897D. I've seen a number of articles but none really match my situation and I wondered if anyone here had any advice....
We've a Hy-gain explorer 14 tribander beam and a trapped dipole for 40 and 80m. I've looked at the Yaesu ATUs and other separate units to go with the FT-897D but there seem to be pros and cons in all directions. I don't plan to be portable or mobile but I am a little space constrained - I work from home and the shack is one end of my work desk! Needless to say it is not on during the work day but it's a fast commute at the end of the day!
I don't have an amp at the moment, it just the FT-897D, but we may consider one in the future if things go well.
Thoughts, comments, suggestions all welcome!

Thanks,
Jenny G7BBP

Hi,
It depends on one's needs. I shall eventually use my FT897D as a Maritime Mobile station aboard my sailboat and intend to use a SGC SG-237 Smartuner just against an insulated backstay and with about 20 feet of steel chain dropping in the water. It should be quite simple and nice.

28502. Mem/VFO knob problems on used unit

Yahoo group: FT897 (2009)
Date: 2009-12-08 11:51:31 UTC
From: pascalpete
Topic: 28502 Message: 28502

Greetings.

I am a new ham and just bought a used ft-897D. It arrived yesterday and within 5 minutes of hooking it up I came across what I believe is a significant problem. The seller tells me this is normal across aging FT-897D's, but I have never come across this in any review or search results...and I certainly read a lot about this radio before settling on it.

When I rotate the Mem/VFO knob, be it in tuning mode or to move through menus, a part of the time the knob starts "reversing" its function. That is, when I am spinning the knob clockwise to increase the frequency, the numbers go up...but sometimes they start reversing and coming down. The menus seem to work the same way. They start going to the higher letter menus but then will "jump" down low several menus.

The knob also feels very "loose" to me, but granted this is the first time I've ever put my hands on an FT-897D.

I contacted the seller and told them I wanted to return the radio for a refund but they urged me to check online and that I would see that this is common for this radio. He said that just spinning the knob rapidly will get it working in the correct direction (which it seems to, but doesn't help "fine tuning" much) and that lack of use of the knob over time leads to this behavior (he was controlling the radio via a computer).

My fear is that this knob is getting ready to "go", and since it is used for nearly all operations and settings on the radio, if it fails I am totally screwed.

In the 30 minutes that I played with the radio I certainly did realize that the FT-897D *is* the radio I want. I would love for this to be just a nuisance and not a major problem, but I don't want to be naive about it either.

I would appreciate it if anyone has some insights on this issue.

Thanks in advance,

Peter Lee

The rotary encoder 'knob' is bad and needs to be replaced. It is not expensive and if you are in the least bit electronically minded, you an replace it yourself. Sometimes, carefully removing the knobs and vacuuming out the dust and lint around the knob shaft will help.

I have also read where that shaft is easily broken if 'bumped' while moving it around.

If you don't want to deal with it, insist the seller take it back...it will not get better.

No, it's NOT normal, it maybe more common than Yaesu would like but it ain't normal. I have a problem with the knob and I looked into repairs. About $135 plus shipping to a place (can't recall just now) that was recommended for repairs from Yaesu. I got a quote; an hour and a quarter @75 plus the part. total about 135 (Maybe that did include the shipping) Anyway, the front face needs to be removed and the knob has to be removed from the circuit board. More than I want to try. So I live with it. I have to press hard (varying amounts) to toggle the knobs functions. I know that's not what you have going on, but it sounds like you may need the knob replaced nonetheless. BTW I bought mine new but didn't use/realize there was a problem until past the warranty. Yes, it's a great radio, get one that works. > > When I rotate the Mem/VFO knob, be it in tuning mode or to move through > menus, a part of the time the knob starts "reversing" its function.  I bought mine brand new 5yrs ago and the knob has always been floppy, it is on a plastic shaft and there has been numerous questions about this. My mem knob also goes backward it seems to happen randomly, however as you say if you turn it fast it works correctly, the rest of the radio works fine on all modes etc. Paul KB2VEC

Greetings.

I am a new ham and just bought a used ft-897D. It arrived yesterday and within 5 minutes of hooking it up I came across what I believe is a significant problem. The seller tells me this is normal across aging FT-897D's, but I have never come across this in any review or search results...and I certainly read a lot about this radio before settling on it.

When I rotate the Mem/VFO knob, be it in tuning mode or to move through menus, a part of the time the knob starts "reversing" its function. That is, when I am spinning the knob clockwise to increase the frequency, the numbers go up...but sometimes they start reversing and coming down. The menus seem to work the same way. They start going to the higher letter menus but then will "jump" down low several menus.

The knob also feels very "loose" to me, but granted this is the first time I've ever put my hands on an FT-897D.

I contacted the seller and told them I wanted to return the radio for a refund but they urged me to check online and that I would see that this is common for this radio. He said that just spinning the knob rapidly will get it working in the correct direction (which it seems to, but doesn't help "fine tuning" much) and that lack of use of the knob over time leads to this behavior (he was controlling the radio via a computer).

My fear is that this knob is getting ready to "go", and since it is used for nearly all operations and settings on the radio, if it fails I am totally screwed.

In the 30 minutes that I played with the radio I certainly did realize that the FT-897D *is* the radio I want. I would love for this to be just a nuisance and not a major problem, but I don't want to be naive about it either.

I would appreciate it if anyone has some insights on this issue.

Thanks in advance,

Peter Lee

Hello all,

Been thinking about my shack. I am running Gel-cells for everything.
Without any issues or report of bad audio etc, on my FT897.

The questions is, have you notice or had any reports about your FT897 while
on battery power?

Also, when on internal battery, max out is 20 watts, volt is 13.2 v, while
on internal battery pack.

What do you think? How do you run your station while on gel-cell / battery
systems, how do you set it up?

Topic: 28507 Message: 28507

I bought an LDG FTL meter a few weeks ago. After a couple of weeks, it only worked when I shifted the plug of the connecting cable that goes into the radio, hence and force. Now, even that does not help anymore and the needle only moves when I hold that plug very firmly to the right side when inserted which is not practically. I am sure that others have experienced similar issue. Will change of plug help?

Al,

I'm running my shack: 2 X FT-897D, FT-2800M, FT-8800R, Icom R-75 and Dell Vostro 1500 laptop on a battery/PS system. The 2 X 100 Ah AGM batteries are charged through a WMR PG40S SuperPWRGate driven by a 45A linear PS. Power is distributed via a WMR RigRunner 4012.

In the event of a grid failure the system changes seamlessly to battery power. I get full output power from all the rigs and have never had any adverse remarks about my signal while running on battery power.

Operating time is, of course, dependent on the number of radios I operate and the duty cycle.

If you'd like more info, feel free to email me directly.

28513. Intermittent Static Noise

Yahoo group: FT897 (2009)
Date: 2009-12-09 16:05:23 UTC
From: jrichard333
Topic: 28513 Message: 28513

Howdy,

Has anyone had this problem with their FT-897D? The receiver will develop intermittent static noise. Sounds similiar to static crashes encountered on 80m. This happens on all bands regardless of the mode of operation i.e. AM, FM, SSB, CW, and PSK.

When listening to PSK signals,using DM-780, you actually see an increase in the noise floor of the receiver, using the waterfall, on 20m. The noise will cover up the signals and then go away. It is pretty annoying.

These are the things I have done so far:

1. I disconnected all antennas.
2. I tightend all screws on the top board of the transceiver.
3. I did a master reset.
4. I changed power supplies (FC-30B)

My thoughts are that the static noise is being generated somewhere in the 1st mixing stage of the IF. I am thinking one of my IF filters may be defective, but I am not sure.

First, what kind of antenna(s) are you using and are they resonant for the bands you want to use? Remember that while an AM or FM signal will give you full power readings, SSB will not, because SSB has no carrier other than your voice. So, if you do not have a very strong voice (NOT shouting) you may not get full output readings. Plus, the peaks in your voice may be so quick that the meter may not have time to display them.

Check your antenna(s) with an analyzer (if possible) to ensure they are working on the bands you want. Sounds to me that you are putting out a signal to the antenna, but the antenna may not be putting that signal out.

As far as the settings for SSB, that is something you will need to play with, preferably with someone on the other end of a signal to give you reports, since each persons voice is different and the settings may be different for you.

At this point I do not believe there is a problem with the rig, just need to check a few things and tweek some settings.

You'll need to use the "F" button to activate the multifunction buttons under the display, and scroll through till you find the option there (can't remember the exact option right now, not where my radio is ATM)

once you locate it, you can switch the meter between SWR, and RF, and this won't change till you press the button again to change back.

Cheers

Simon

Take a look at this post:
http://groups.yahoo.com/group/FT897/message/27846?threaded=1

I think is the same problem I have. I didnt solved it yet... I need to send the transceiver back to the dealer.
The problem seems to be caused by a ceramic filter on RX, more exactly CF1005.

best regards,
Cosmin - YO5ORW

This is just a 3.5mm "stereo" plug, the meter is between tip and base
(middle ring isn't used). The meter itself is just an 1mA full scale meter.

I believe there are 2 possibilities:
- The plug on the cable is broken (not uncommon, also, the cable
connection might have broken)
- The socket on the display board is broken (not common,
but not unfeasible if you have used force on the socket)

It's definitely easier and cheaper to test this using a different
3.5mm plug. These are common, even radio shack might have them,
or just swipe a cable + plug from a PC speaker set.
(these plugs are straight and the LDC cable is not, but it's
useful to do this just for testing and take it from there).

If it's the socket that is bust, then it is possible to get a replacement
from Yaesu, but this needs a bit more skill to replace this.

JR,

Your problem sounds simialr to what I had. I ended up sending my back to Vertex Standard for repair. They replaced 3 ceramic filters which fixed the problem. It appears they have seen this problem before. I hope this helps.

Hello G,
                The AVERAGE power on
ssb is normal about 50 to 60 % of full power INDICATED because meters (of any kind)
 cannot react fast enough.   If your SWR is reasonable, say 2 to 1 or better you should
be able to make contacts especially on 40 meters.
                                                                                73

Another thing one can do, albeit a might pricy, (sic) would be to purchase a peak reading watt meter.
The Bird 43, with a kit, works very nicely and is extremely accurate across the spectrum.

Hi JC,

"about 20 feet of steel chain dropping in the water" ???
That's the old remedy for a lightning grounding in an emergency situation.
Are lightning grounds good RF grounds...guess not.

Think about the joys of being able to use your FT897 UNDER SAIL! Forget about good DX-ing from inside a marina with your chain hanging overboard...marinas are extremely RF-noisy with all your neighbour's intelligent high-frequency battery chargers!

Invest a little time on the net, e.g. the SSCA discussion board to find out about good RF-ground systems and counterpises on board a sailing boat.

As a ATU I would recommend the SGC-230 or the CG-3000.
I have the yaesu FC40 but am not satisfied with it's impedance matching range.

Think about the length of your sloping wire antenna in function of the bands you will want to work. 40 m - 17m is quite feasible with a total length of about 9.6-10 meters. On 17m it is about 0.625 wavelength (= 5/8) giving the best gain with low take-off angle. For any higher frequencies you will get strong lobes at high angles so a cloud warmer...
The typical 12-13m backstay wire antenna will give good results 80m-20m but not higher freq.

Good luck,

jan

In ssb 30 to 40watts will drive out 100 watt peaks. You need a peak envelope power meter to read actual output. I use the mh 31 mike in number 2 on the back of the mike and set the ssb mike gain at 40 in menu 83. The only other problem is that propagation is not good on HF yet.

No joy guys, but thanks. On my set, have to push the 'F' button for
menu, rotate the mem/vfo small knob to menu item 61, then rotate the
main dial to select pwr-swr-off, etc. Set SWR, then push 'F' to lock
and return. Won't hold.

The functions buttons--when in menu item 61: a=add/remove from menu
list; b= no effect; c= return to normal without saving.
Drat.

I have to agree with Wayne. Mine does the same thing. Going into menu mode 61 (MTR ATX SEL) gives the options pwr, alc, mod swr vlt, n/a, off, with the main dial, none of which will stay in the multi function row i once setting and returning with holding the F button. The setting seems only to depend only on multi function row i(MTR, XXX, DISP) where XXX is set by either pressing the A or B button below the display. That seems to set the meter display shown in the transmit mode. It is strange that in Multi function row i, pressing either A or B results in the same options being displayed in the transmit mode. Too many menus for the same thing???

Excellent advice, Geert Jan! I did not know that middle ring of plug is not used. I tried another cable that I found (never being used) in my cable collection. It even has got an angle plug on one side so looks similar to original connecting cable with only difference having two rings instead of one.. And it works perfectly.
I remeber having read in a review about this FTL meter that connecting plug is cheap quality and looks like there is some truth in that statement.
Thanks for your advice

This is just a 3.5mm "stereo" plug, the meter is between tip and base
(middle ring isn't used). The meter itself is just an 1mA full scale meter.

I believe there are 2 possibilities:
- The plug on the cable is broken (not uncommon, also, the cable
connection might have broken)
- The socket on the display board is broken (not common,
but not unfeasible if you have used force on the socket)

It's definitely easier and cheaper to test this using a different
3.5mm plug. These are common, even radio shack might have them,
or just swipe a cable + plug from a PC speaker set.
(these plugs are straight and the LDC cable is not, but it's

28536. SSB POWER Displayed??

Yahoo group: FT897 (2009)
Date: 2009-12-11 12:40:56 UTC
From: kc3vo@aol.com
Topic: 28536 Message: 28536

With the average power meter, your SSB power should show 30 to 40 watts when transmitting at an actual 100 watts using voice modulation. Readings of higher value on average reading meters, such as 50 watts or more, generally show that excessive mike gain and/or too much compression is being used, with distorted audio being the end result! Such signals are not pleasant to hear on the bands, and can be a reason you are not making contacts! Get a good, PEAK READING R.F. power meter if you want to see the "100 wattrs" indication on SSB, and REDUCE mike gain/compression to show 30-40 watts on the average power meter. The radio will actually work BETTER this way!--(See the chapter on SSB in the ARRL handbook or equivalent)--73, KC3VO

From: pascalpete
Topic: 28502 Message: 28538

Thank you all for your input. I really appreciate it. It matches up with what I heard from Yaesu.

I contacted Yaesu Tech Support and the engineer immediate said the problem was almost certainly with the encoder on the dial. It might be as simple as dust in the encoder. I recall the seller saying that there was dust in the shack environment (like I would expect in any home).

The good news is that the tech indicated that it was a "user repairable" issue as long as I had even a small amount of soldering skill. Well, my soldering experience ended 30 years ago and I was never all that good at it to begin with. However, I sent an email to our Radio Club President asking if anyone in the club had experience with soldering and he indicated that he was a bench technician with 18 years experience and had everything we needed if a repair was needed.

Turns out the part that needs replacing can be had for $2.50...so I ordered THREE of them just in case! The tech is also mailing me an exploded view of the radio so I can have a fighting chance of figuring out how to disassemble the thing. I have no idea how hard these things are to take apart...perhaps a rolling video camera on the work area will help me get it back together again after I have it open. ;)

The radio is certainly usable...my fear was this being a prelude to a massive failure. I am very glad that it looks to be a simple fix...or I can just live with it. Either way I LOVE this radio so far and told the seller I will be keeping it.

Thank you again for your responses. Everything else about the radio is wonderful even though I have only used it on 2 meters thus far. Now I have to turn my attention to getting an antenna that I can use on HF.

Thanks again.

With the average power meter, your SSB power should show 30 to 40 watts

when transmitting at an actual 100 watts using voice modulation. Readings of

higher value on average reading meters, such as 50 watts or more, generally

show that excessive mike gain and/or too much compression is being used,

with distorted audio being the end result! Such signals are not pleasant to

hear on the bands, and can be a reason you are not making contacts! Get a

good, PEAK READING R.F. power meter if you want to see the "100 wattrs"

indication on SSB, and REDUCE mike gain/compression to show 30-40 watts on the

average power meter. The radio will actually work BETTER this way!--(See the

chapter on SSB in the ARRL handbook or equivalent)- -73, KC3VO

From: dogdavetika
Topic: 28514 Message: 28540

Yes, I concur, the menu 60 and 61 are for the external meter. See page 19, METER jack picture. It says it uses menu 60 and 61.

However, I put a calibrated generator on the 897 and the s meter doesn't even register until the signal level reaches -85dbm which is in reality S7. So the meter is for reference only, don't expect to make any real measurements from it. However also, I measured the MDS at CFIL as -122dbm and 300Hz at -126dbm, so that is not to say the receiver is not very sensitive. The CW-T light comes on at -113dbm at 300Hz and -109dbm at CFIL. This is all at 10MHz.

Your mileage may vary.

28542. Radio output damaged?

Yahoo group: FT897 (2009)
Date: 2009-12-12 21:39:01 UTC
From: kybarney
Topic: 28542 Message: 28542

I put an external meter (diamond SX-600) on the back of the radio to measure output. 440Mhz puts out 17 watts max and all HF bands max out at 90 watts. 2 meters tests perfectly at 50 watts. All tests were conducted with 1:1 SWR on a dummy load. I find it odd 2 meters tests out perfectly but HF is 10 watts off and 440MHZ is off too. Would you expect these same readings on a brand new radio "out of the box?"

PS - I understand there is no difference in S units between the radio's max power and my findings....just curious if this is normal and if you would expect a "new" radio to have those measurements.

Thanks and 73,
Kyle

28543. Dots? Basic question on FT-897 meter reading...

Yahoo group: FT897 (2009)
Date: 2009-12-12 23:44:47 UTC
From: marshallstax
Topic: 28543 Message: 28543

Sorry if this a dumb question, but at page 38 of the owner manual, at Digital Mode Operation, I can read:
"....While transmitting, view the ALC meter; a few "dots" of ALC indication should be observed. If not, rotate the dial knob to adjust... for seven to eight dots on the ALC meter."

Does the term "dots" refer to the actual pixels or to the S-1, S-2, etc, pips running along the top of the bar below the actual meter indication? Eight dots is right at the first pip (S-1) on the meter.

Pictures would help... a "few dots" is, to me, a barely-showing meter indication, maybe below the first (S-1) pip on the scale. I count, starting from the far left pip:

0 = 1st dot
1 = 8th dot
2 = 15th dot
3 = 22nd dot
4 = 29th dot
5 = 36th dot
6 = 43rd dot
7 = 50th dot
8 = 57th dot
9 = 64th & 65th dots

For some reason I had thought that Yaesu meant the pips rather than the dots/pixels. I'm very new to trying to use digital modes and "a few dots" seemed like too low a signal. I just want to hear it from an experienced user.

Thanks!

Robin, N6RLS

The digital modes such as PSK-31 does not require a very high output so the ALC would not have be driven too high to get a good signal out and have a good QSO. I have ran as low as 15W on PSK-31 and talked to Colombia, SA. You need very low input to drive the transmit on the 897.

Err, what makes you think that your SX-600 is correct? The readings (on the SX-600) are 15% low on 70cm and 10% low on HF. The likelyhood that the radio is wrong is about the same as it is that the SX-600 wrong. Most likely is that the true value is somewhere between the two. On two metres, probably both are wrong - just in the same direction.

RF Power measurements made outside a lab environment are likely to be more than 10% out. Even the renowned Bird 43 is likely to be 10% in error on a typical reading.

A distant user would not notice the difference between your 90W and 100W. Try working somebody distant using 90W on HF and then reduce the signal level to 50W. Ask him to identify when you are using which power.

Seasons Greetings

Geoff

Robin: I've run 30 watts at a digital gain of no more than 10 (7dots)and I've had good luck the last year or so. If you go high with digitsl gain you will just be too wide. I usually run about a dig gain of 6-7 and it gives me almost no ALC with good output.
A nice clear signal is what you want with just enough power and dig gain quite low to be effective not overpowering and distorting.
If you use HRD you can set the Dig U and Digital Gain right from the PC screen and not have to go into memory 37 etc.
30 watts is plenty of power, in fact 20 will cover the world with low gain setting.

Sounds like you're trying awfully hard to talk yourself into sending the rig back.

You won't sleep well until you do.

I don't even know what mine puts out on 440 because there is very little activity around here and I couldn't care less. 17 is close enough to 25 to hit any local repeater most anywhere.

Can't suggest anymore than what I've already done, Kyle.

Sorry.

Topic: 28516 Message: 28548

Hi
I had some problems almost indentical, with my own tranceiver, on FM full 100w no problem at all but in AM/SSB, max. 0,5w (no joke).
I have returned the radio to the store and they have repaired for me, telling me than it was a software problem. (it’s a second hand radio).
Before that, on the phone, they adviced me to engage the PROC and to make some corrections in menu 74.

Best regards
Cornel

Try a short press of "F" key to get into "MFi" menu. Then scroll with
MEM/VFO CH" to get to "MTR SWR DISP" & press "B" button to select either SWR
or ALC or PWR.

No joy guys, but thanks. On my set, have to push the 'F' button for

menu, rotate the mem/vfo small knob to menu item 61, then rotate the

main dial to select pwr-swr-off, etc. Set SWR, then push 'F' to lock

and return. Won't hold.

The functions buttons--when in menu item 61: a=add/remove from menu

list; B= no effect; c= return to normal without saving.

Drat.

GW4ZOM

Actually you be very lucky to see your output power of 100watts ssb on any meter probably show 20 -30 watts if that while your voice peaks maybe 100!!
use the ALC set it for max on voice peaks and you should be getting out just fine remember the higher the frequency eg 10m your output will be less than on the LF bands
AM/FM only will show true output from your rigs meter and don`t forget to add the db gain of your antenna compared to a dipole

In ssb 30 to 40watts will drive out 100 watt peaks. You need a peak envelope power meter to read actual output. I use the mh 31 mike in number 2 on the back of the mike and set the ssb mike gain at 40 in menu 83. The only other problem is that propagation is not good on HF yet.

IMO this is one place the manual is WRONG!

In PSK mode the quality of your signal is measured by its IMD. IMD gets worse (smaller number) as a result of overdriving the rig. If ALC is kicking in AT ALL, then your input is too "hot" and the ALC is clipping. Your signal is producing the dreaded double (or triple or more) railroad tracks on everyone's waterfall. Getting a clean signal is a function of soundcard input, power setting, and frequency. What makes it more difficult is that they are interdependent and not linear. Change any one of the three and you change the quality of your signal.

Unless you have a way to evaluate your IMD at your station, you don't know what the signal looks like to the rest of the world. OK, you can and should ask, but at that point, your signal is already out there and if it's really bad, no one will respond to your call anyway. Personally, I use an IMD meter by kk7uq (google it). It isn't a perfect solution, but it is a lot lot cheaper than a spectrum analyzer and gives you a good indication of whether or not you are polluting!

If you don't have a way to monitor your IMD, then the rule should be NO ALC SHOWING!

Why you need to relay amplifier from CAT jack?
There is ACC jack.
You just need to change J1027 jumper position from TXREQ (default pos.) to TX-GND.
J1027 is located near ACC jack but I forgot exact location.

To answer your question...

From the manual on running AFSK:
6. Following the instructions for your TNC's software, activate
the transmitter from the computer keyboard; this
should cause the AFSK output from the TNC to be sent
to the radio. While transmitting, view the ALC meter; a
few "dots" of ALC indication should be observed. If not,
rotate the DIAL knob to adjust the AFSK level within
the FT-897D for seven to eight dots of indication on the
ALC meter.

It would stand to reason that they don't mean the individual pixels.
and what is meant is 'incremental graduations' or pips as you call them.

For AFSK an ALC reading around mid scale would probably work fine. This would imply that you are running full power too.

The thing about digital modes such as PSK, olivia and so on.... is like the others have said, 30 watts out or less is usually more than sufficient.

If you are going to run these other digital modes then set up your transmitter so that there is about 20-30 watts indicated on the power meter. The ALC meter should indicate no or very little activity. ALC tends to compress the signal amplitude and ALC pumping(rapid QSB) of signal levels can make you signal unreadable on the other end.

I usually run psk 31 without any ALC action and just watch the watt meter for ~25 to 30 watts output. This is done by adjusting the audio interface audio drive level into the rig. Works great.

Hope that answers your question John KB0NE

Hey Robin! Don't feel bad about asking this question. Personally I have read that section of the instructions at least 50 times trying to understand what Yaesu means, or meant to say. I assumed pips, but if I adjust ALC to a few pips (or 7 or 8 which is a lot more than a few), then I may have violated one of the basic laws of the digital airwaves. I certainly don't want to be hunted down and shot like a rabid dog by marauding bands of ALC-haters by making my psk31 too wide. Nor would I enjoy my ham neighbors coming over to my house in the cover of darkness to stick pins in my coax for having too wide of psk31 tracks. Power out is really low on my 897 if I show zero ALC. I hope, like you do, that some "kind knight of the round table" will explain to us, or point us to a detailed article that explains which modes must be ALC-free, and which don't (like perhaps cw & rtty where many people run very high power). I wonder what is allowable for the new WINMOR or PACTOR, and for all the other modes? I note that Rob in ZL-land has big antennas to get out well-- does that mean I too can compensate by turning on my linear with no ALC, hihi? What about out-west here when a European says he is using 100 watts on psk31 to call CQ and shows only a thin line on the waterfall, and I assume that I need 100 watts to get his attention? How does all this relate to the FT-897, showing pips on ALC per the instructions, the mode, and all the other variables at play? I doubt there is a quick and easy answer to ALL our questions, but I'd sure like to learn all the answers! Here is hoping that we get a comprehensive response, not just the usual "no ALC" stock answer. 73 de Kent ad7hk

28562. Another question regarding ALC

Yahoo group: FT897 (2009)
Date: 2009-12-14 02:01:13 UTC
From: willgord
Topic: 28562 Message: 28562

Since others seem puzzled about managing the ALC I will toss in my question.

I run PSK31 through my 897D, using SignaLink USB and Digipan. In the "Nifty E-Z Guide to PSK31 Operation," the following point is made: "From the standpoint of transmit signal quality, you need to make certain there is no ALC (automatic level control) action while transmitting. Any ALC activity will likely cause distortion of your signal (resulting in poor IMD)."

Do I only turn on ALC when I hit the B button that chooses among Power, modulation, SWR and ALC? Or is ALC always in play and I must do something else to turn it off?

Problem I am trying to solve (if anyone else uses their 897 for PSK) is that I am able to make contact with stations with no problem but the waterfall soon breaks up and I lose the connection.

Thanks for your help folks.

You cannot turn ALC off. Once your modulation level reaches a certain point relative to your output power, it takes action. For best signals in DIG, you must not see any display when the ALC button is pressed. If you see any indication in ALC, it means your transmitter is compressing your modulation and you will have IMD. Keep your power/modulation at a point below any ALC action and you should be OK.

I'm guessing at the name. Why don't we start with your name and call? Then I know who I'm talking to. You mentioned "split". Split has nothing to do with programming for repeater use. Also, it won't work if you don't program the info into memory. If you're trying to program your FT-897 to operate repeaters, let me know and I'll send you the proper steps written out.

Make sure you don't have the lock on. This, if active, will disable the multifunction button's, and other controls on the front panel. You've possibly hit the lock when trying to adjust the VFO.

28569. Program FT-897 for repeater operation

Yahoo group: FT897 (2009)
Date: 2009-12-14 04:36:36 UTC
From: Carl Wulfestieg
Topic: 28569 Message: 28569

Ric-

Well, the manual isn't helpful - it's all there but not all in the same place.
Here we go:

1. Tune in frequency (the repeater output frequency)

2. Set up CTCSS Tone (Note: If CTCSS Tone not needed, go to Step 3)
a. Press "F" momentarily
b. Select multi-function row "e"
c. Press (A)(TON) to activate tone encoder [TEN]
d. To change CTCSS frequency press (A)(TON) 1 second
e. Rotate dial to select proper frequency
f. Press and hold "F" to save new setting

3. Press "F" momentarily

4. Select multi-function row "b"

5. Press (A)(MW) momentarily

6. Rotate MEM/VFO/CH knob to select channel for storage

7. Press and hold (A)(MW) for 1 second (2nd beep)

You've probably guessed that you have to store the info in a memory channel to make it work.
Follow the above steps exactly and you should be in business. Good Luck.

Carl-
Thanks the directions helped a bunch and having followed them I have a channel stored on #2.

I still suspect something may be amisss. After I go to multi-function row "d", and I push the[A](RPT) key I get no
+, or - indicator in the display, nor is there a tone indicating the [A](RPT) key has been pressed. It is my understanding from the manual that this is how the transmitter frequency shift is programed,

Your help is appreciated!

I didn't understand that bit of the manual, so I set up using a dummy load and Wattmeter by turning the volume up until it hit 5W then turning back a bit until it was working at about 3W on the Wattmeter and the Power Out display on the 897 was below top. Nothing shows up on the ALC display then.

There is a potential problem with some modes that the Wattmeter display may be misleading because the average power is somewhat lower than the peaks. My Wattmeter is set to show peak, but may not always keep up. The tuning tone from some programs may help.

I've had good contacts, even intercontinental, on quite low powers even though we are still in a solar minimum. I wouldn't claim to have a particularly good antenna - a dipole in a smallish garden. The narrow digital modes are quite power efficient.

If you're pressing RTP (button A) then you should see a little + or - appear in the top of the display. Repeatedly pressing the button This is the repeater offset mode, which is an example of a split only it's all done conveniently for you rather than setting it up the hard way. The offset is set up in the menus.

Just a point with the repeater shift.
My 897 has been moded to allow the extended rx, this disables the auto repeater shift functions.

This might be what you are seeing?

The difference is in "keying." PSK is phase shift keying (BPSK31, BPSK63, QPSK31, etc.) FSK is frequency shift keying (AMTOR, PACTOR, RTTY, etc.) And CW is continuous wave keying (carrier on-off)
For a good explanation of "Why No ALC in PSK Mode" have a look at this.

That's a good article. It also shows in Figure 2 why a mechanical Wattmeter
may not show the true peak level.

The instructions, like many I've read, seem to have you set the radio to its
full 100W mode then use the wattmeter to set the real output power much
lower. I prefer to use the radio's power setting control (really just a gain
control in this case) to adjust my power.

I use a Signalink interface nowadays, as I work with modes such as SSTV.
Signalink tell me that their interface should not distort when its output is
set high. Some sound cards will distort, "100%" corresponding to above unity
gain of the digital samples coming from your software.

If the power setting is just a gain (or drive) control then that is OK, however, I am pretty sure that the 897 sets its power level by acting on the ALC!!!

Which is why the recommendation is to set the power level to max and adjust for the required power on a meter, so that the ALC does not operate.

Mechanically yes because that's a convenient variable gain stage in the circuit. It will do so by adding a constant level to it, or changing its target output to a constant level. It's only if gain varies over time that there's trouble.

I have myself a Software Defined Receiver board to play with, so may have to have a go with one computer listening to and analysing my output as I transmit. Could be difficult given the high field strength near my antenna, though it should be a valid test to transmit into a dummy load and get the SDR board to detect the small leakage from that.

Subject: [FT897] Program FT-897 for repeater operation

Ric-

Well, the manual isn't helpful - it's all there but not all in the same place.
Here we go:

1. Tune in frequency (the repeater output frequency)

2. Set up CTCSS Tone (Note: If CTCSS Tone not needed, go to Step 3)
a. Press "F" momentarily
b. Select multi-function row "e"
c. Press (A)(TON) to activate tone encoder [TEN]
d. To change CTCSS frequency press (A)(TON) 1 second
e. Rotate dial to select proper frequency
f. Press and hold "F" to save new setting

3. Press "F" momentarily

4. Select multi-function row "b"

5. Press (A)(MW) momentarily

6. Rotate MEM/VFO/CH knob to select channel for storage

7. Press and hold (A)(MW) for 1 second (2nd beep)

You've probably guessed that you have to store the info in a memory channel to make it work.
Follow the above steps exactly and you should be in business. Good Luck.

Okay, very basic question. What can I do to reduce modulation? I have cut mic gain way back, cut power to 20 watts. What else can I do to reduce modulation and keep from triggering ALC?

It's entirely down to the amount of signal you're feeding in and the input gain (mic gain) setting.

Which port are you using to feed sound in? You may need to use an attenuator or matching transformer to drop the level from your sound card to the level expected by the radio. A resistor network makes a simple attenuator. I've not had problems using the "Data" port on the back of the radio direct to the sound card.

> >

There appears to be somewhat of a misunderstanding going on here, if ALC is functioning correctly it does not compressed of your modulation.
ALC usually operates by reducing the gain of a driver stage, and as long as the transmitter is operating in a linear region there'll be no additional distortion due to ALC action.

Reducing the gain of the driver stage does not mean that it's linearity will necessarily be reduced. With the digital modes as long as the envelope is moderately constant, compared to the ALC a attack and decay time then all the ALC action will do is reduce the peak output power, and as long as the drive level does not cause any of the transmitter stages to go into non linearity there should not be a problem.

However, to guarantee the situation the best solution is to set the transmitter for maximum output power and slowly increasing the drive until the required output power is achieved.

So what is the answer to the OP's question? It seems that two entirely different answers have been given -- neither of which actually answers the OP's question.

Answer 1: The FT-897 manual suggests having some reading on the ALC ("... seven to eight dots on the ALC meter ..."), so the answer is "... seven to eight dots on the ALC meter ...", even though not many people have responded to the question of what Yaesu means by "dots" (are they pixels or are they hash marks on the meter?).

Answer 2: Some responders talk about having "... no ALC action ...", but haven't actually described what "... no ALC action ..." means in practical terms. Does it mean no deflection on the ALC at all, or does it mean seven to eight dots on the ALC meter, but with no fluctuation on those seven to eight dots.

I've measured my PSK signal with an IMD meter and I've asked people nearby and far away to look at my signal on the waterfall. Both methods give me good marks on my signal when I drop digital gain to the point where I have about seven hash marks on the ALC meter but without any fluctuation. Interestingly, that results in my seeing power output at about 1/4 of the reading I get when I just hold down the key in CW mode.

I thought it mean pixel, because that is what a dot on a dot matrix display is for me. Graduations are something different. They could have used a less ambiguous word.

From: Steve Yates
Topic: 28562 Message: 28590

ALC itself IS a form of distortion. It does prevent the transmitter stages from being overdriven but once activated, the ALC feedback itself causes a non-linear response (input increases/output does not). The ALC action compresses the signal which usually helps the intelligibility of a voice signal if not over done. In normal voice SSB, the objectional distortion products will often fall outside the passband of the transmitter and are filtered out. This is not the case with narrowband digital modes when the transmitter's passband can still accept a ~3 kHz wide voice signal.

The ALC action compresses the signal which usually helps the intelligibility of a voice signal if not over done. In normal voice SSB, the objectional distortion products will often fall outside the passband of the transmitter and are filtered out. This is not the case with narrowband digital modes when the transmitter's passband can still accept a ~3 kHz wide voice signal.
>

ALC in itself is NOT a form of distortion, and ALC feedback will not cause distortion per se. Where distortion will occur is only at the onset of a CHANGE in ALC level. ALC does not compress anything, it changes the gain of an amplifier, the amplifier is always linear just its gain has ben changed.

Once a constant ALC level is established there is no non-linear response. This is particularly relevant in digital modes where mostly there is something approaching a constant envelope to maintain a steady ALC level.

As long as any breaks or changes in level are shorter than the release time of the ALC loop there will be no change in level and no distortion.

Jeff,

I understand where you are coming from. My experience with the FT-897D and the PSK31 modulation envelope is that the ALC does not treat it as a constant envelope. The ALC meter flickers like crazy. In other words, there is a lot of CHANGE in ALC level during which time things are not linear. Without some true IMD measurements our theories don't mean much anyway :-) I personally don't want to see the ALC flicker when I use PSK31.

73,
Steve - AA5TB

Hi folks, I used to have an Icom 703, but it got stolen.
Was gonna replace it with another 703, soon I hope, but got to thinking about the 897D. I mainly use d it a a reciever. ANy help/ comments app.

David.

We could do with a difinitive answer on this - perhaps some time with the right test gear.

The ALC circuit is, according to the modifications sheet posted here earlier, a resistor-capacitor circuit. That means it is a low pass filter with a time constant that's probably not too big. It will respond to any fluctuation in envelope power above its threshold. The fluctuations in PSK31 are 31 times per second because it uses a sine shaped pulse. It is slow enough to give a visible flicker on my Watt meter. The graph on the PSK31 distortion discussion shows this. That discussion also shows that even a small change in ALC level will introduce distortion, though the discussion modelled ALC as very fast acting. A slower ALC should be better.

Noise in my part of town is high enough that someone would have to be seriously overdriving to show up on my waterfall display. Some stations do and they're all over. Maybe the 30dB down or 20dB down side lobes are not visible to most listeners when there's only a little ALC action.

It's why I understood the requirement in answer to the original question as pixels not graduation marks. We want little ALC, but if you're just hitting it then you know you're using the full power.

Still, this means that if one of us can find time and kit we could do with performing some real tests. I have kit to do some rough testing. I can transmit into a dummy load and use a spectrum analyser on another PC with another receiver which should be representative. I'll try to fit time in to get all the kit together and do it, document it and write it up. I'd offer the proviso that the receiving computer has a poor quality sound card which will limit accuracy - but then poor quality sound cards on transmit would also limit quality.

- Richard

There are 2 time constants involved, a fast attack and a slow decay, and the fact that they are RC does not mean the time constants have to be short!!

The loop is designed to cope with the fluctuations encountered in speech so sould be able to cope with 31Hz fluctuations.

>The graph on the PSK31
> distortion discussion shows this. That discussion also shows that even a
> small change in ALC level will introduce distortion, though the discussion
> modelled ALC as very fast acting.

If you are takling about the same article that I looked at, it does not model ALC action, merely compression in an amplifier, which is not what is actually going on (unless the Tx is overdriven in the first place).

ALC will not cause compression, it will however, cause a transient change as the gain is adjusted. This will cause distortion, but unless the loop is very fast acing, and the envelope has large amplitude changes, it will be far less than a continuous overdrive, which is what is modelled.

All that said, it is probablly better to remove ALC from the equation if you can. That is why there is the recommendation to set for max o/p level and use the drive level controls to set the required power out. That way unless you approach the actual max power you will not have any ALC action at all, and everything remains linear and constant gain.

28597. FT-897d Knob Broke (shaft)

Yahoo group: FT897 (2009)
Date: 2009-12-17 22:04:01 UTC
From: Jim M
Topic: 28597 Message: 28597

My clarifier knob shaft broke from a book sliding on the shelf. It didn't require any unusual force to break the knob shaft. So I called Yaesu and found that is it meant to break instead of transferring force to the pcb, which is quite costly!

The replacement encoder "pot" is part # Q9000790 @ $1.39 each. So order several pots guys, I imagine that once will not be the only time it breaks!

>

Please don't think your question is silly.
If I understand right, your trying to select CTCSS.
It sounds like your in the wrong menu.
When your in Mfd RPT REV VOX pressing A changes the offset to either simplex, + or _.
I think you want to be in Mfe TON TDCH. Now if you press A and hold it, it will take you to Tone Freq. Select the TONE and press and hold the F button.
Hope that helps.

28601. Re: Dots? Basic question on FT-897 meter reading...

Yahoo group: FT897 (2009)
Date: 2009-12-19 01:23:58 UTC
From: marshallstax
Topic: 28543 Message: 28601

Thanks.... based on your and other responses to my original note, I think Yaesu means pixels, not the pips (gradations) on the bar. Everyone says, in one way or another, that there should be no, or almost no, ALC activity in the digital mode on the FT-897.

Since Yaesu says "a few" and "seven or eight" ("dots") the meaning is cloudy, given the sometimes tortured wordings found in certain instruction manuals. And as the "seven or eight" reference is within the number of gradations shown, the confusion arises.

The feeling I get though is less is best and that, in this situation, Yaesu is trying to say 'almost no' response on the ALC meter. Going to 7 or 8 gradations would be way too much. Going to 7 or 8 pixels/dots is like saying 'almost no response' on the meter, which seems to be correct.

Thanks again to you and all who answered.

Robin, N6RLS

--- In FT897@yahoogroups.com, "Kent & Shirley" <larsenks@...> wrote:
>
> Hey Robin! Don't feel bad about asking this question. Personally I have read that section of the instructions at least 50 times trying to understand what Yaesu means, or meant to say. I assumed pips, but if I adjust ALC to a few pips (or 7 or 8 which is a lot more than a few), then I may have violated one of the basic laws of the digital airwaves. I certainly don't want to be hunted down and shot like a rabid dog by marauding bands of ALC-haters by making my psk31 too wide. Nor would I enjoy my ham neighbors coming over to my house in the cover of darkness to stick pins in my coax for having too wide of psk31 tracks. Power out is really low on my 897 if I show zero ALC. I hope, like you do, that some "kind knight of the round table" will explain to us, or point us to a detailed article that explains which modes must be ALC-free, and which don't (like perhaps cw & rtty where many people run very high power). I wonder what is allowable for the new WINMOR or PACTOR, and for all the other modes? I note that Rob in ZL-land has big antennas to get out well-- does that mean I too can compensate by turning on my linear with no ALC, hihi? What about out-west here when a European says he is using 100 watts on psk31 to call CQ and shows only a thin line on the waterfall, and I assume that I need 100 watts to get his attention? How does all this relate to the FT-897, showing pips on ALC per the instructions, the mode, and all the other variables at play? I doubt there is a quick and easy answer to ALL our questions, but I'd sure like to learn all the answers! Here is hoping that we get a comprehensive response, not just the usual "no ALC" stock answer. 73 de Kent ad7hk

28603. Beeping on Transmission

Yahoo group: FT897 (2009)
Date: 2009-12-19 05:19:36 UTC
From: Risk
Topic: 28603 Message: 28603

Hi guys,

My FT-897D every so often, beeps whilst I am transmitting. 80m or 40m its not overly choosy when it does it. I read something about stray RF getting in via the 2m antenna. So I disconnected that. Nothing much has changed. Now the interesting part, is that it sets the running man running when Lock is not activated. When lock is activated, it just beeps. Weird, and annoying. Any clues ?

On way back from 4S7 the clarifier shaft broke here too. I inserted a wooden peace into the axis and clued altogether with epoxy (german two component "UHU plus"). For future trips i will bent a aluminium cover to protect the panel during transport. On the left side are two screw holes (antennatuner holes) and on the right side you have to make your own...
In the meantime i ordered a new encoder, the reasons Jim reported, convinced me.

From: Lew Phelps K6LMP
Topic: 28597 Message: 28605

I've fabricated an alluminum "protector" that wraps around the lower right corner, but instead of screwing it in, I just attached it with a lot of "industrial strength" Velcro. This is more than strong enough to hold in place from the impact of a fall from desk height, and it can be removed almost instantaneously. I've had several shafts broken from accidental impacts. I think it 's a VERY common problem with the 897. Despite its "ruggedized" looks, the knobs are quite vulnerable.

From: RicardoH
Topic: 28560 Message: 28606

I figured it out: When I first turned on my radio my exuberant button pressing led me to press multi-function row "a" [C]

When I went back to look at where the +, - should appear on the display I noticed that I had [SPL] displayed. I went in set multi-function row "a" [A]. Now it works as the manual describes. I was going to return the radio as faulty today!!!

Thanks for everyone who tried to help me and please bear with me for a while.

There is new software for doing PSK31 with the iPhone/iPod Touch. Since the iPhone is not a conventional computer, and has no PTT capability, just audio in/out, my question is as follows:

Will VOX work through the data port of the FT-897D? If not, could I wire a connection up through the mic connector that will allow VOX? Thanks.

VOX does work with the 897 in digital mode. Use the "DIG VOX" menu (No 40).
I use the data port on the back of the radio.

PSK on a phone size device - sounds interesting!

Otherwise known as RIT (Receive Incremental Tuning). On SSB if the person you're talking to is off tune lets you tune to them on receive without changing your transmit frequency. (Otherwise they may adjust for your change and you end up chasing each other up or down the band).

I'd strongly encourage you to continue the discussion on-list if possible. Moving discussions of general interest (and the INRAD filters frequently come up in discussion) off the list defeats the purpose of the list in sharing pertinent info among all list members (and in some cases, repeating the info). In point, I have the INRAD 2kHz filter in my FT-897D; what would you like to know?

Note that the mail archives may also answer your question, as questions about the INRAD 2 kHz are frequently asked and answered.

those only exist in unmodified US versions. When you modded it to open the Tx you lost that. The only way I am aware of is to manually program them into other memories, perhaps as a group if you want the band tuning function. This is a firmware limitation that was placed on the radio, largely so that regulatory compliance could be achieved more easily.

The radio itself is fine, it just does not know that its a US model anymore after the mod since the US model does not have the more liberal Tx ability.

Just be sure that when you program the memories you do it right, the FCC publishes center frequency and since its sideband this is not what is displayed (on most radios not just this one).

I have not tried it yet. The software is in Italian - hopefully in English soon.

The software's Italian site indicates that one uses the four-conductor (two for stereo, and one each for common ground and mic.) audio jack.

I would love to see an all in one digital ham app.

28622. What are the symtoms of a blown final?

Yahoo group: FT897 (2009)
Date: 2009-12-23 00:29:52 UTC
From: willgord
Topic: 28622 Message: 28622

Have used my 897D for about a year now. In the past few weeks, I find myself no longer getting noted in pile-ups and find it hard to hear stations the way I used to.

Have been running PSK31 a lot lately, at 20 watts on 20 meters. Stations hear me and respond, but their signal fades after a brief exchange.

Finally, the meter reading for power seldom goes more than midway across the scale.

Described all these symptons--especially what looks like a low power reading--to a veteran ham who laughed and said, "you've got a blown final." Another ham said what did I expect to happen when I ran a 100% duty cycle mode like PSK31--even at 20 watts.

So, does it sound like a blown final--or just bad band conditions that make it harder to make and complete contacts. I am a fairly new and can use all the help and advice I can get.

Hi Gordon,

The only way to know if you have a final problem is to put a reliable power meter & dummy load on the output and measure it. Anything else is guessing.

The fact that the receive also seems to be dropping off may mean that it is just conditions or there may be something else wrong such as antenna changeover in the rig. It may also be a problem with your antenna system, too.

Not every problem with a transceiver is a blown final and if you are getting some power out, then it is probably not the final.

73....Eric VK2VE.

i had not thought of a blown final nor even knew what one was. But I was describing my failure to make many phone contacts and the head of communications where I work (who is also a ham) and he said it sounded like a blown final. I am making plenty of PSK31 contacts at 20 watts, but there the incoming signal fades and I lose the connection.

Pardon the baby question, but am I correct that a blown final would only affect the outgoing signal and that reception issues would be something else?

Yes. Normally only the outgoing signal is affected. No audio output is what would be experienced, maybe high SWR as well. The radio will key up but your meter would show no power behind it. Does your head of communication do PSK? The receive portion of the radio is a separate circuit from the finals, therefore, it sounds to me like fading band conditions.

If you are now having problems with receive as well, you need to check the antenna system from the radio to the antenna and see if there is something loose, cracked, broken or missing (or chewed on - squirrels used to love eating my coax).

Good luck!

Dennis - N8BMB

28626. Re: What are the symptoms of a blown final?

Yahoo group: FT897 (2009)
Date: 2009-12-24 01:36:12 UTC
From: willgord
Topic: 28622 Message: 28626

Obviously not a blown final. I was advised to switch to FM mode and key the mic and see how the power meter responded. Pushed PTT and the power level simply pinned itself--indicating power going out.

Antenna could be a problem. Being in a New York City apartment, I considered all possibilities and settled for a Super Antenna inside the apartment with a quarter-wave counterpoise cut for 20 meters dangling out the window and down the side of the building.

Any squirrel that wanted a crack at that would have to scamper across a vertical wall, roughly 120 feet off the ground.

Probably band conditions but seemingly not a blown final.

Well I chose to become a ham late in life because I wanted a hobby for my senior years that would keep posing endless challenges. Ham certainly fits the bill.

Thanks for taking the time to respond and comment. 73 and the best of holiday wishes.

28627. meter

Yahoo group: FT897 (2009)
Date: 2009-12-24 14:16:59 UTC
From: nr3r15
Topic: 28627 Message: 28627

Anyone have the problem of the SWR/PWR/MOD/ MTR indicator not working on transmit or tunning up ? I have two 897's. I set both to exact settings. One works fine the other one doesn't show Meter indicator. This happens on FM/AM and HF modes. I interchanged mics, and antenna with both radios, still nothing. I hate to do a CPU reset due to lots of saved information, so I thought I would ask first. CPU reset as last resort.
Thanks 73

I homebrew'd my data cable for my FT897D using a 6 ft PS2 keyboard extension cable and I used a 20dB pad for the audio to go into my MacBook.

PSK31 & RTTY are working like a champ via DigiPan with VMware under WinXP and natively with Fldigi on Mac OS X 10.6

I haven't attempted the CAT cable yet.

28632. Comparing 897D with FT-450

Yahoo group: FT897 (2009)
Date: 2009-12-25 16:25:05 UTC
From: willgord
Topic: 28632 Message: 28632

I am a generally satisfied user of an 897. I have worked 60 countries and 41 states, despite having to run a screwdriver antenna inside a New York City apartment building.

But I have had access to a Yaesu F-450 and am tempted to add one to my shack, so that I play with both.

One point is that I bought the 897D because my fallback, if I couldnt' make contacts with my indoor antenna, I could operate by battery in Central Park, a block away. Reality is I have made many contacts from the apartment and going battery would be running 20 watts at ground level against 100 watts from 120 feet up (the approximate height of my 14th floor apartment.

Curious to hear what anyone has to say about the 450, pro or con, and any comparisons you might make about the 450 vs. the 897.

Merry Christmas to one and all

Gordon
K2GLW

From: nr3r15
Topic: 28632 Message: 28633

My opinion is they are pretty much the same radio, just different package, but I guess you know that the 450 does not have VHF/UHF. To me that is the only difference.

Topic: 28637 Message: 28638

Dave,

I had a similar problem with the S-meter display on my FT-857D (functionally equivalent to FT-897) in that my S-meter would either read S0 (in absence of signal) or S9++(in presence of signal). I was able to clear that malfunction by running the "relay cleaning" routine on the rig. To perform this routine depress the BAND "DWN" & "UP" buttons while turning the rig on. Run this routine a few times to ensure relays are clean. Before you do perform this routine I will advise you to make note of any special settings you might have set as well as any special settings on any memory channels as the rig "may" perform a reset (as my FT-857D did subsequent to clearing the malfunction).

Mark (NM7L)

I've owned both radios and the FT450 has an advantage over a stock FT897D in that it has digital IF filltering which you can tailor to suit your requirements.
It also has a larger more informative display and is priced about $150-$200(USD) less than the FT897D.

That being said,I was able to buy an FT897D with the LDG897 tuner and a couple of battery packs and quick charger for portable as well as base use and subsequently sold the FT 450.Purely because I like to operate portable PSK31 and the FT897D really shines at 20W on the digital modes.

That's kind of funny because when the FT-450 first came out, it was more expensive than the FT-897D. I had purchased my FT-897D before the FT-450 came out so I was a bit surprised at the higher price, especially because it did not include 144 and 440 MHz. Still I am impressed with the overhauled CAT protocol on the FT-450 and the DSP on the IF.

Thanks Dave,

For some reason, I did have the AGC turned off. The S meter works fine now, other than the bands are dead and it's hard to find a signal loud enough to move it. <g>.

Muchos gracias,

28646. Solar charging FNB-78 batteries for an FT-897D

Yahoo group: FT897 (2009)
Date: 2009-12-27 13:27:58 UTC
From: Blaine
Topic: 28646 Message: 28646

Good morning! I am new to the group, in fact new to ham radio operation, so bear with me . . .

I decided to get into radio because I own two ranches separated by some distance, and need a means of emergency communication. Power outtages lasting hours to weeks are a reality in this area, and I need something to fall back on when computers, landlines and cell towers lose power.

I did quite a bit of reading and online research, and settled on the Yaesu Ft-897 with the FNB-78 batteries. But given the limited operating time on batteries, and my need to communicate when I'm out on my Honda Fourtrax, I know I've got to come up with some kind of alternative charging system when I'm out moving cattle, or headquarters loses power.

Okay, I'll cut to the chase...here are my specific questions:

How do I know what wattage solar panel to buy to charge the FNB-78s? The radio evidently needs to operate at 13.8 volts, so I'm guessing the solar panel voltage needs to at least exceed that.

Do I need to match the amperage output of the panels with the amperage draw of the FT-897 in operation? Where do I find this information?

What kind of solar charge controller do I need to keep from overcharging the Yaesu batteries? Specific makes and models would be helpful.

I've seen several solar cell flexible sheets that can be rolled up for transport. This would be really great! Any recommendations on makes and models for both rollable and rigid solar panels?

And my last question...is anyone familiar with the new technology A123 lithium nanophosphate batteries? I read about them in an online article, and they sound promising. Where can you buy these?

Anyway, that's it for now. I've searched forum posts for solar, and come up with some interesting discussions, but still had the specific questions I could not find an answer to.

BTW, this is an awesome forum! But I could also use some direction to resources on learning ham radio operation. Something along the line of "Ham Radio For Dummies". Thanks!

28649. noise level in new FT-897D

Yahoo group: FT897 (2009)
Date: 2009-12-25 22:00:47 UTC
From: wa3pak
Topic: 28649 Message: 28649

I just received a new FT-897D and am quite impressed with it. I have however noticed that it has a higher noise level than my regular station rig, an Icom IC-718. In a side by side comparison today on 20 meters, there is quite a difference in noise and ability to copy the same station between these two rigs with the Icom being the better receiver.

I love my new rig, but am concerned that the reciever has a higher noise level than I expected. I am sure this has been noted by others.
For those of you more experienced with this transceiver, have you found any tricks or hints that may eliminate or at least reduce the noise level?

I have tried the DSP, but upon engaging that, the noise level drops, but so does the intelligibilty of the signal. It seems to help if I reduce the RF gain a bit. Any other suggestions from the experts to a brand new owner of this incredible little rig?

Many thanks in advance for your insights.

73,
Brad

just be careful that you do not do commercial traffic :)

> How do I know what wattage solar panel to buy to charge the FNB-78s?
> The radio evidently needs to operate at 13.8 volts, so I'm guessing
> the solar panel voltage needs to at least exceed that.
>

charging batteries and running the radio are two different issues. The batteries will run the radio, but only one of them at a time. This means that you can charge one while using the other. Manuals and other items suggest strongly that you not charge a battery you are using.

With a solar panel be sure that you have a blocking diode so that you dont feed power back into the panel.

As for what wattage you need, that depends on a few variables. Presumably you are going to have some type of charging unit that will sense when the battery is charged and discontinue power (or most of it, falling back to a trickle charge). Batteries prefer to be slow charged, this increases their life but decreases operational pleasure. You end up waiting to be able to operate.

According to Yaesu those batteries will run the unit for 8 hours (4 hours each) with 95% of the time idle, 2.5% receiving and 2.5% transmitting, or something very close to that. Additionally you will not want the battery to go completely dead, usually at about 10.5v the radio has problems operating off the battery.

If you look at the w4rt ofc (one fast charger) it wants an input of 26-28vdc and nominally it will want a bit over 1 amp input. Extra amperage will not harm anything, the charger will use only what it needs. Generally if you do not supply enough it will just charge at a slower rate. This charger is designed to fully charge the battery in 4 hours, or the life span of the other battery. This can end up causing you to "cut it close" when it comes to trying to use it at night, assuming you are using all the usable life out of those batteries each day. The OFC can also be used with an inverter or wall current for AC

charge when that is available. For more info see http://www.w4rt.com, Yaesu's charger is similar in function although I believe it takes slightly longer to charge and I believe it is AC only.

> What kind of solar charge controller do I need to keep from
> overcharging the Yaesu batteries? Specific makes and models would be
> helpful.
>

I would rely on the more flexible OFC which takes both AC and DC than a solar charge controller. The biggest thing is to get one that will detect that the batteries are full and dump the current, usually into a dummy load integrated into the unit. Most of them do this to some degree (I have not seen a proper controller that does not, but I leave the option for them to exist).

> I've seen several solar cell flexible sheets that can be rolled up for
> transport. This would be really great! Any recommendations on makes
> and models for both rollable and rigid solar panels?
>

You will want to check the surface area required, amount of sunlight required, and power output. Generally speaking the flexible ones provide less power per square [meter|foot|inch|etc] although there are some newer advances in the materials being used that is starting to level this out a bit.

> And my last question...is anyone familiar with the new technology A123
> lithium nanophosphate batteries? I read about them in an online
> article, and they sound promising. Where can you buy these?
>

afaik there are a few places that sell them, I have not seen anything yet that will fit inside the radio that can be fitted with the connectors. Right now it seems the manufacturers are looking towards high volume production runs only and are less than interested in making anything custom without requiring a substantial outlay of cash (at least the ones I have contacted specifically about making drop in replacements for the 897).

> BTW, this is an awesome forum! But I could also use some direction to
> resources on learning ham radio operation. Something along the line of
> "Ham Radio For Dummies". Thanks!
> -Blaine
>
Depending on what you specifically want, I would suggest hitting up some local repeaters and seeing who is on and talking to them. Ham radio is a very large subject and it pays to specialize a bit in the things that interest you and not pay that close of attention to the things that do not. For example if you are interested in digital modes it pays to specialize in that, if you are interested in SSTV to that, but if you do not care about either, you can safely ignore them :)

I would recommend learning how the radio works, what makes a radio wave propagate, learning at least generically about antennas, ground wave vs skywave propagation, what makes an antenna NVIS as opposed to DX. There are many books out there, virtually every ham radio store has a selection of books that can assist you in finding the subjects that interest you. With radio, no matter how much you know, there is always something else to learn.

28652. Re: No S Meter reading on FT897D

Yahoo group: FT897 (2009)
Date: 2009-12-28 03:24:11 UTC
From: Risk
Topic: 28637 Message: 28652

Hi guys I have a similar issue, and I am not sure if I need to take the set back to the place where I bought it or not to have it recalibrated.

Its only 3 months old so I am guessing either the SMeter needs calibrating or something or there is an issue with it.

Basically the S meter doesnt read much past S7-S8 when having the gain full on. Obviously it is reading the AGC voltage and turning back the gain will keep it steady. In my case if I rotate the gain dial counter clockwise, the S reading increases gradually as the noise in the back ground disappears. The reading on the S meter in this case will read usually up and over S9 etc. But it stays there and doesnt change. So rotating the dial fully clockwise to have gain set at its highest gives me the noise in the background of course, and the S meter reading is usually around S6-S7 depending on which antenna I have selected and the tuning applied.

Ok, so now here is the question, does this set increment its S meter value in 6 or 3 db increments. I can understand that the S-meter is showing what it does, if its increments are 6db. But if it is 3db per increment, I think I need to do something here. Now I tried the Relay Cleaning thing. Im not sure its made a difference, there is no one on the net today and conditions are crappy so I will wait and see.

The next question is, AGC is on Auto. What difference will changing from Auto to Fast or Slow make to the S meter reading. I cant see it will solve my problem but Im giving it a go now and am currently still waiting for someone to come on with a large enough signal to evaluate.

Also I dont know if any of you guys have experienced it or not, but sometimes I get a beeping when I transmit (I know this is off topic but seeing as I am here now one of you guys might know) now the set is tuned, and the sets SWR meter doesnt really register anything which is comparative to the low VSWR reading on the MFJ949E I have. So I am not overly sure its a VSWR issue. But it beeps, and turns the running man on. This doesnt happen all the time, just every so often, and is consistant usually for that frequency when it happens.

Ive tried re-tuning and sometimes it still does it, sometimes it doesnt. It often occurs more so when I have the mic closer to my mouth, obviously that is going to place more voltage on the system to be applied to the rf amp, anyways, maybe someone has had a similar issue.

Cheers

The yaesu charger is DC only. It has the same connector as the power connector on the 897. There is also a round wall wart type connector for a 24vdc input for the OEM wall wart.

You can connect a solar panel to the 12vdc input but you need somewhere near 2.5 amps.

I use a 26 watt folding solar panel and have quit using the internal batteries and switched to using an external SLA battery with the solar panel and it works great.

The OEM charger also makes enough noise on 17 meters to make it useless while charging. I was able to reduce the amount of noise to an acceptable level by adding capacitors to the filtering circuit.

>
> Basically the S meter doesnt read much past S7-S8 when having the gain full on.

That does not seem correct, but check what happens iwhen you turn the pe-amp and attenuator, on and off. You should get 9++ readings with very strong signals, if your antenna is half decent.

>Obviously it is reading the AGC voltage and turning back the gain will keep it steady. In my case if I rotate the gain dial counter clockwise, the S reading increases gradually as the noise in the back ground disappears. The reading on the S meter in this case will read usually up and over S9 etc. But it stays there and doesnt change.

That is normal operation.

> So rotating the dial fully clockwise to have gain set at its highest gives me the noise in the background of course, and the S meter reading is usually around S6-S7 depending on which antenna I have selected and the tuning applied.
>

Sounds normal, depending on your local external noise floor.

> Ok, so now here is the question, does this set increment its S meter value in 6 or 3 db increments. I can understand that the S-meter is showing what it does, if its increments are 6db. But if it is 3db per increment,

The answer is, along with most radios, neither. I have never seen an S meter that gets close to obeying either of those laws and the 897 is no different. The meter is quite non linear, and does seem to vary from unit to unit.

>I think I need to do something here. Now I tried the Relay Cleaning thing. Im not sure its made a difference, there is no one on the net today and conditions are crappy so I will wait and see.
>
> The next question is, AGC is on Auto. What difference will changing from Auto to Fast or Slow make to the S meter reading. I cant see it will solve my problem but Im giving it a go now and am currently still waiting for someone to come on with a large enough signal to evaluate.

All it will do is make the meter, and the AGC respond faster or slower, in fast it will not hold its level during speech so it may appear to read a little lower when in slow or auto on ssb.

>
> Also I dont know if any of you guys have experienced it or not, but sometimes I get a beeping when I transmit (I know this is off topic but seeing as I am here now one of you guys might know) now the set is tuned, and the sets SWR meter doesnt really register anything which is comparative to the low VSWR reading on the MFJ949E I have. Blaine,

The answer to your last statement is easy to give, there is a book called Ham Radio for Dummies and it is great reading.
It will help you learn a lot of basics about Amateur Radio including the basic on antennas. I believe there is some info about
solar power in there also.

You should enjoy it. It is available at almost all bookstores and on Amazon.com.

Sounds good! For the emergency purposes you state, the regular batteries should do just fine. If you need more capacity, just be sure that you don't use the radio in the course of your farming business ... you can use it to communicate w/ your family for non-business purposes, but not with co-workers for business purposes.

Amateur radio has a huge amount of spectrum space that other (business) services would like to use, and the best way we can keep that from happening is to adhere to the rules, and not give those that want to use the spectrum, a cause for complaint.

What is your antenna tuned for? If you are using an antenna tuned for 75 or 40 that is what is going to happen if you are using 160.

Check menu #75 to see if you are set to 75 watts. As you switch from band to bnd you have to set it for each band at least once.

28665. Re: [FT897] noise level in new FT-897D

Yahoo group: FT897 (2009)
Date: 2009-12-28 23:13:44 UTC
From: Minto Witteveen
Topic: 28649 Message: 28665

I too find the 897 relatively noisy. I bought this rig after a large period of non-activity. When I compared the 897 receiver with my old Kenwood TS130 the difference frankly astounded me. The 897 sometimes sounds like the whole neighborhood has converted to large plasma TV's and el-cheapo Chinese dimmers.. L .. and when I check with the TS130 they all seem to be gone!!!.

Don't get me wrong, I have never regretted buying the 897, it is a fine piece of hardware. But with all its features - all mode HF, VHF, UHF, compact/portable and low priced, it IS a compromise rig.

As for mitigating measures: I too find the DSP worthless for suppressing the (built-in!!) noise. It suppresses the noise but indeed also the intelligibility.

Surprisingly a lot of the noise is in the 3KHz+ spectrum and using a good cut-off filter in the LF part works wonders (tested with a good filter at the output). I did a quick-and-dirty fix by adding a R+C feedback to the TDA2003 LF amplifier. 150 Ohms + 470 nF in series between pins 2 and 4. You may need to experiment with these values to get a result you like.

With these values I got rid of most of the high-pitched noise without affecting the audio too much.

I think I stole the idea from a mod I found at mods.dk.

A sharper filter should be better but that would require more modifications.

Kind regards,

Minto pa3bca

Subject: [FT897] noise level in new FT-897D

I just received a new FT-897D and am quite impressed with it. I have however noticed that it has a higher noise level than my regular station rig, an Icom IC-718. In a side by side comparison today on 20 meters, there is quite a difference in noise and ability to copy the same station between these two rigs with the Icom being the better receiver.

I love my new rig, but am concerned that the reciever has a higher noise level than I expected. I am sure this has been noted by others.
For those of you more experienced with this transceiver, have you found any tricks or hints that may eliminate or at least reduce the noise level?

I have tried the DSP, but upon engaging that, the noise level drops, but so does the intelligibilty of the signal. It seems to help if I reduce the RF gain a bit. Any other suggestions from the experts to a brand new owner of this incredible little rig?

Many thanks in advance for your insights.

73,
Brad

If you go to www.vmware.com and download their virtual server, it will work. One problem with Microsoft's Virtual server is the inability to "share" a USB device, but you can do that with Vmware. Vmware server is free, it's a little more difficult to setup, but it runs faster and has less problems I think. If you want to spend a little $$, you can purchase Vmware desktop which is easier to use, but the free server works fine.

My personal preference is the microHAM USB III. You specify cables when ordering - they are included in the price. The sound card in this unit seems 10X better than my laptop soundcard. No affiliation with microHAM. Just like this product.

My preference is to do it with a sound card. I have had good results this way, providing the software behind it is good. This also lets you do things other than psk31 if you are into that without having to buy multiple TNCs.

I documented the interface cable, which I made for only a couple dollars in very commonly available parts using the data jack on the back of the radio.

This is not my design, on that page I give credit to the original author, which I believe is one listed on the soundmodem page (a software TNC for linux). The biggest thing I did was list the pins on the data port to connect to (data port is a ps/2 keyboard connector, using a ps/2 keyboard *and* mouse extension cable and cutting that works great).

I use a pl2303 usb->rs232 adapter I got for $5 or so off dealextreme.com, its the most common usb/rs232 chip, and drivers are readily available for every platform. The only thing I cant readily do is pactor due to patents (technically its illegal to do pactor 2 & 3 in a software implementation without a license from SCS). I do have pactor 1 via software though.

28671. Re: No S Meter reading on FT897D

Yahoo group: FT897 (2009)
Date: 2009-12-29 12:52:10 UTC
From: Risk
Topic: 28637 Message: 28671

Thanx for your reply Jeff, I appreciate it very much.

I think the relay clean seemed to help a bit actually so cheers to the fellow (sorry haven't got that post up at the moment) who suggested that one. I am now actually getting people to read S9 which is a far cry from before. No one has peaked it over that yet, so I am going to take the set back and get it re-calibrated. Cant hurt and it is still under warranty anyways.

As for RF in the shack, well that is quite a possibility, albeit, I do have a good earth (okay bit hard to really quantify that (without a megger at hand and a relatively good reference point), but I do have a 6ft copper pipe rammed four feet down into the ground outside the room (in this case kitchen/dining area) where my set is. Everything that needs to be earthed (radio/tuner/antennas etc) are earthed back to that point. Nothing is left unearthed or relying on earths from the GPO. So all earths are the same potential. Save setting up a Faraday cage around the gear, there really isn't much more I can do as unfortunately this is the only location in this house I can set this up.

I am in the Royal Australian Navy and I am an Electronics Technician (Communications) so I am likely to be posted elsewhere at a moments notice, thus everything I have done here is temporary as the house is rented. So I have tried to make the best of a poor situation as far as real estate is concerned. But I have to be able to rip everything up in a very short period of time.

Applying the IPO and Attenuator certainly drops the S meter down 2 levels so that much is working. I have applied this with all 3 antennas (Vertical, G5RV and the new Squid Pole Dipole) I have and same results.

I figured as much in regards to your thoughts on AGC, and it certainly acts as you said it should.

The interesting thing about the beeping is that it only occurs when I have a perfect VSWR reportedly from both the set and the antenna tuner (MFJ-948E). I did research this beeping issue before I posted, it appears some people have had a similar issue with beeping which reportedly occurred due to the VHF/UHF antenna being too close to the HF antenna. This could have been an issue, but it has carried over to the Dipole that I have, and in any case I have unplugged the VHF/UHF antenna which should have isolated that issue.

Now the fact that when this occurs the VSWR is perfect and I mean absolutely perfect, tweaked my interest. Reason being, if there was some kind of re-radiation off of any structures nearby, this should have indicated a high VSWR not a low (or next to none) VSWR.

Weird one. Never seen it before. Anything not perfectly bonded to the floating earth on a Warship will certainly re-radiate if in my HF antennas path, and cause the VSWR to that transmitter to go through the roof. Not a safe situation as you can expect. Hence I spend a lot of time running around with a Megger checking the bonding throughout the upper decks.

Anyways, wont bore you any further. Cheers very much for the information Jeff. I really appreciate your prompt reply especially at Xmas.

I hope you and your family maintain a safe merry xmas holiday and a happy new year.

73's to you.

The ARRL book, "Emergency Power for Radio Communications" is the best all-around introduction to emergency power situations that I've found. While it's designed for radio power, he also talks about all kinds of emergency power applications around the house and farm. Mike Bryce, the author, is an engineer and a ham. I've seen his posts now and again on the FT817 forum.

Living in a rural area, I really appreciated this book. It's available on Amazon for $15.56. Well worth the money.

I use a direct lead from the Data port on the 897 to the soundcard on my laptop. It works great for PSK 31 and other digital modes like SSTV, etc... You just have make sure that your speaker and mic settings are adjusted just right to key and modulate the radio. Also use DIGIPAN software.

Check the archives of this group with the search term "solar charging". I remember earlier this year we were talking about this subject and in particular about charging a bat. while

it's being used and the noise generated, etc.
I have been looking at a portable solar panel made by Sunwize. It has a nice fold-up case and vinyl protective pouch. You also have the doubler option that will double the output.

I switched from a Kenwood TS-440SAT and found the noise level on the FT-897 to be higher. The DSP helps a little, but in my opinion not much. Mostly adjusting the RF Gain helps. I bought the FT to have hf, vhf and uhf in one unit, but I think the much older TS-440SAT was more user friendly and had a better reciever.

From: mallrat_ld90
Topic: 28622 Message: 28680

Definitely not a blown final for you. You wouldn't be getting 20w out, it would be more like 2 if they were blown, with one blown, (and this is not exact since I have not looked at the schematic for a while) but you would get 1/2 the power of what you set with one bad and one good, but I have also never seen one bad, it is generally two or nothing.

Test it with an am/fm/cw carrier into your watt meter. In case the radio doesn't give you the real info, but when I blew mine once, it let me know on the 897 display I was outputting nothing, but they blew to open, if it blows to short, I would guess the same thing would happen, but I don't know without looking.

Either way, if you set 20 and got 20, your good, and it does sound like conditions. I have been having the same stuff happen constantly lately. 10-20 second cw contacts is getting ridiculous with how often it is happening.

Hi,

Within VM you would run XP (or any other OS you fancy) you would install that OS as if it were a new computer. VM makes a computer on your computer

The issue you may have is that you need that OS too install. So you would need the XP disc and relivant licensing.

Hope that helps

It might be a hardware problem with insufficient voltage on the USB ports that fail to work.

I use the Prolific 64-bit driver with a Toshiba Satellite running Windows 7 and I have not had any problems with the three ports on this computer. I have two Prolific based serial cables; one for the FT-897D and another for my VX-7R that I use with VX7Commander.

I have been using the Windows X64 architecture since the initial release of Windows XP X64 edition and I am still surprised at the lack of 64-bit driver support for many common devices. I was very happy to see Prolific supporting the 64-bit architecture even back then and wound up scrapping the Belkin F5U109 serial adapter I used to use with my VX-7R because I could not get 64-bit drivers for it.

Cliff -

Try going to the InRad site and check if the stock# is the same for both rigs.

28686. How much power should my 897D put out?

Yahoo group: FT897 (2009)
Date: 2009-12-31 00:52:13 UTC
From: willgord
Topic: 28686 Message: 28686

I realize my rig will never put out the full listed 100 watts. but what would be a "normal" level of power given an SWR just a tad over 1.5. I am running barefoot, no amp. I am limited by having a screwdriver antenna inside my apartment with a counterpoise, cut quarter-wave for 20m hanging out the window.

Thanks and Happy New Year to all.

Aloha All,

My display does not show the multi function row after holding down the function key. It only shows the menu modes on the display. Did I press the wrong button somewhere?

Much Mahalos in advance,

Darrel WH7UY

Don't hold the button down for the Function menus. Just tap it. When you depress the Function button for 1 second, it goes to menu mode.

One must hold down the function key to access the menus. Try a quick press
of the button
and turn the small select knob, that should get the multi function row
selections. Watch the S
on the display, the quick press of the function button should change the S
to MF1, then rotate the select knob to change the multifunction row options.

28691. Microphone Gain / Power Setting

Yahoo group: FT897 (2009)

From: wowi2010
Topic: 28691 Message: 28691

There are no stupid questions, but there are stupid people asking questions. Here we go: What is the effect of microphone setting on the transmission power? If I set mic gain on 50% and TX power on 100% what is the actual transmission power than? Is it same as mic on 100% and TX power on 50%?

It probably would be the same for SSB signals, but only as long as no stages in the amplification process from microphone to transmitted signal reach any of their limits. For an FM signal, an AM signal or a CW signal (OK, no mic in that one) then the TX power setting more directly effects TX power.

In any system with multiple "gain stages", stages of amplification, you want to run each stage at the right level. It's the best way to reduce noise and to prevent overload at any stage. Run a stage too loud and it will clip and distort which is very bad in amateur radio. Run it too quiet and the next stage has to work harder and can introduce noise (OK, a small amount on the scale of things. This is amateur radio not studio sound.)

When you're transmitting FM then the power of the carrier is set by your TX power setting. Mic gain controls the deviation of the signal - how far either side of the nominal carrier frequency the modulated carrier swings. In an FM system the mic gain will directly effect how loud you sound to the person listening regardless of whether or not you are giving them a strong signal or a weak signal, so unlike with SSB where the auto-gain-control will keep the receiver volume steady, with FM the mic gain setting is more important.

Your best bet is to set the mic gain properly. Then in whatever mode you work it will be right. Also features such as Auto Level Control will work correctly and the TX power setting will give a good indication of the actual TX power you will use.

I hope this helps

The mic gain goes not have any effect on the max power out of the radio. Set the radio for 100W and you will get a max of 100W, set it for 50W and you will get a max of 50W.

However, the mic gain will determine whether you achieve that max power with a particular voice level and microphone, or whether you over drive the radio and cause distortion and splatter.

The mic gain needs to be set such that you achieve the max power, but do not over-drive any of the stages in the radio.

For SSB I don't think that is correct; setting the o/p power to 50% (=50W) would cause the ALC to attempt to limit the power to 50W regardless of mic gain settings. There may well be some short transient over-shoot, but the ALC will very quickly wind the power down. Too much mic gain will cause distortion, but still at 50W, too litle will mean that you do not achieve the max o/p power.

Things are also not that simple due to intentional limiting/compression in the mic stages designed to stop overdriving of the transmitter. There is as max audio drive level available regardless of gain setting, the distortion just gets worse.

In FM the carrier power will be whatever you set it to be and the mic gain will effect the deviation. However, the max deviation is set by a control that is not the mic gain. Due to limiting in the mic stages the max deviation is set after the limiter. Consequently too little mic gan will result in under deviation, but too much mic gain will not result in over deviation it will result in distortion due to excesive clipping. (unless the internal deviation control is set too high).

This is why reducing the mic gain (or talking furher from the mic) is not a satisfactory solution to over deviation reports. It is the max dev setting that should be changed. Otherwise the next time the mic gain is changed, or you talk louder or closer to the mic, the over deviation will be back.

The max dev setting should be set such that the deviation is correct when the mic stages are just in limiting, then it will be impossible to over deviate, the mic gain in then used to bring the audio level just up to limiting on peaks.

The case when running mic at 50% and power at 100% giving 50% out was a very simplified case assuming no ALC or othe non-linearities taking effect. It could be achieved - as in you can set the radio to "100W" and crank down the mic gain until your external power meter shows a 50W SSB signal being transmitted. It's an odd thing to do.

There was a conversation here not long about about deliberately running the radio like this in digital modes where you have the control to make sure you're below ALC level. I argued that it was best to run the input just below ALC threshold and use the power setting to set power - ALC not being good for digital but being good for voice. I ought to have a go at some measurements some time on this - time being of the essence!

I don't believe the ALC will "compress up" on the 897. Another conversation earlier on this group suggested that the "Voice Processor" didn't do a that good a job of it. I did some experiments with a stage vocal mic in a desk stand through a "Behringer Shark 110" compressor and got good audio reports.

I tend to use the modulation depth meter on the 897 when adjusting or deciding how close to talk to the mic. I have the external home-made "FT-Meter" to show SWR on transmit.

28696. Re: PSK31 with iPhone

Yahoo group: FT897 (2009)
Date: 2009-12-31 16:39:21 UTC
From: Edward Thorpe
Topic: 28607 Message: 28696

I managed to interface the iPod Touch to radio audio and have had limited success receiving PSK-31. The interface was through the audio jack and strange things can happen I suppose because the audio jack also implements certain control signals to the iPod (and iPhone I presume). That said, I am unimpressed with the decoding of anything but very strong signals. I don't think I'll throw away my computer for PSK just yet. The app is, however, proof of concept and hopefully performance will be improved. At some point I will try an interface through the docking connector. I have found a source of connectors and prototyping boards.

I don't know how good a test mine was, but I just sat my iPhone on top of my notebook, and had it throw a paragraph or two out with DM780 in psk31 mode.. gotta say i was pretty completely unimpressed! - even the slightest bit of background noise would kill off it's very slight bit of accuracy.. And lord knows HF sure has a lot of background noise! I think I'll stick with DM780 :-p it's not like the portege really weighs much more than the iphone, especially when you take all the rest of the gear related to the radio into account :)

Cheers,

DG
